

Supplement to: Associations of schizophrenia with arrhythmic disorders and electrocardiogram traits: a genetic exploration of population samples

Jorien L Treur, Anaïs B Thijssen, Dirk JA Smit, Rafik Tadros, Rada R Veeneman, Damiaan Denys, Jentien M Vermeulen, Julien Barc, Jacob Bergstedt, Joëlle A Pasman, Connie R Bezzina, Karin J H Verweij

1. Local genetic correlation analyses

- a. Supplementary Figure S1 (overlap in locally correlating regions across trait-pairs) 2
- b. Supplementary Figures S2 to 10 (Manhattan plots with locally correlating regions) 3-7
- c. Supplementary Table S1 (global and MAF-stratified genetic correlations) 8
- d. Supplementary Table S2 (list of locally correlating regions) 9-11

2. Functional annotation analyses

- a. Supplementary Figure S11 (GWAS catalogue phenotypes) 12
- b. Supplementary Figure S12 & S13 (GO biological processes enrichment) 13-14
- c. Supplementary Figure S14 (Differential tissue expression) 15

3. Mendelian randomization analyses

- a. Supplementary Figures S15 to 16 (scatter plots causal findings) 16
- b. Supplementary Figures S17 to 18 (funnel plots causal findings) 17
- c. Supplementary Figures S19 to 20 (leave-one-out analyses causal findings) 18-19
- d. Supplementary Table S3 (Cochran's Q statistic to assess heterogeneity) 20
- e. Supplementary Table S4 (Multivariable MR analyses) 21

1. Local genetic correlation analyses

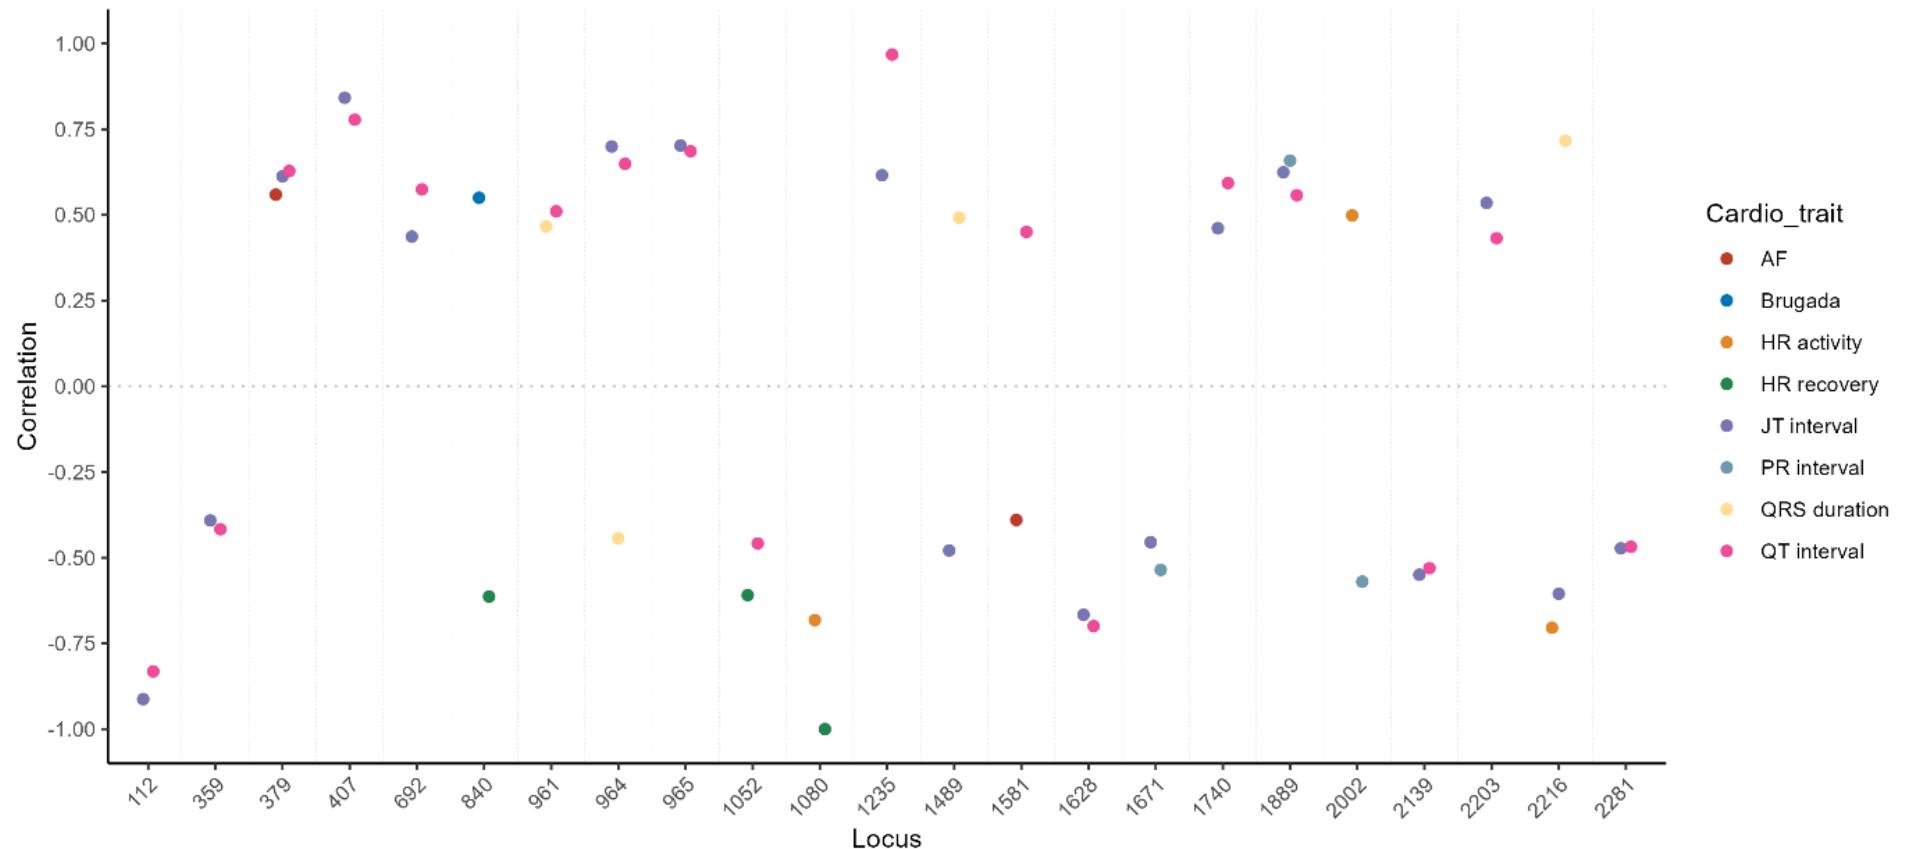

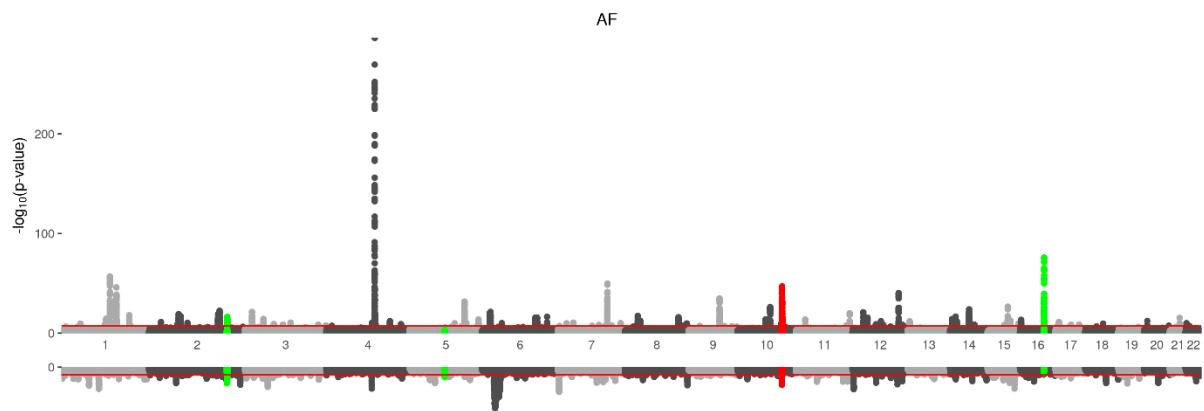

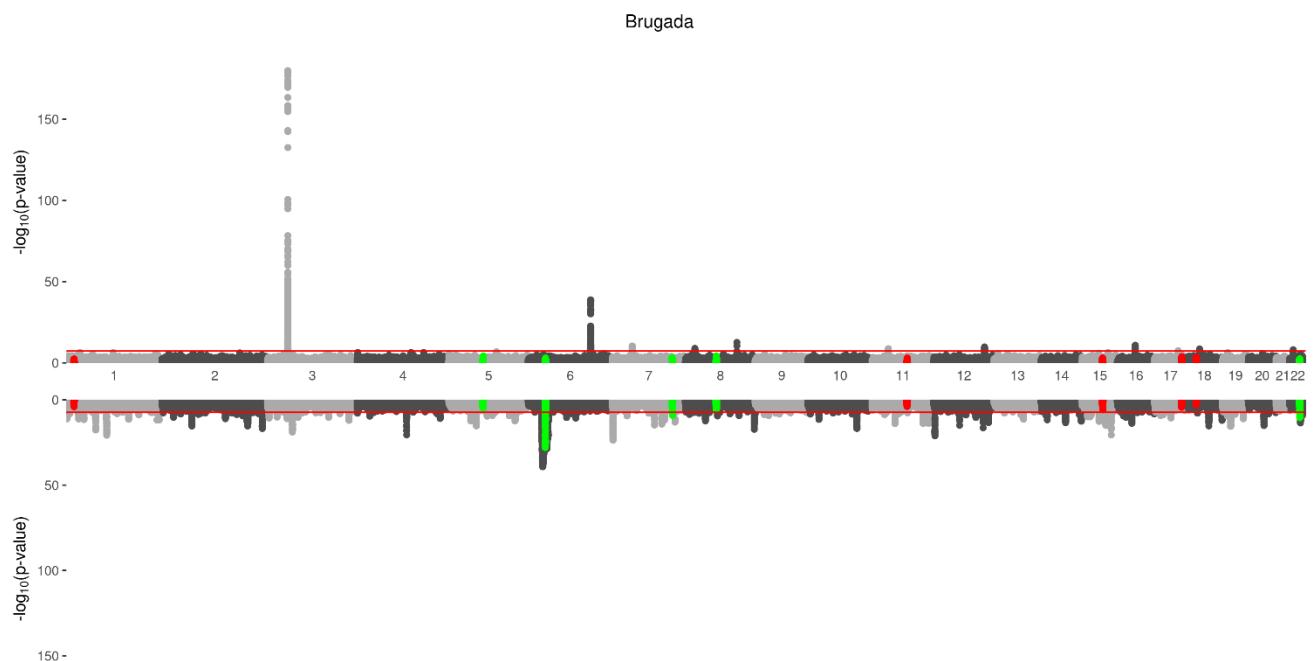

Figure S1. Regions that emerged in two or more cardio trait – schizophrenia local correlation analyses are plotted. The x-axis shows the 23 regions that overlapped between LAVA analyses and the y-axis shows the local genetic correlation between the cardio traits and schizophrenia for the involved regions.

Schizophrenia

Figure S2. Miami plots for the Atrial fibrillation and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

Schizophrenia

Figure S3. Miami plots for the Brugada syndrome and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

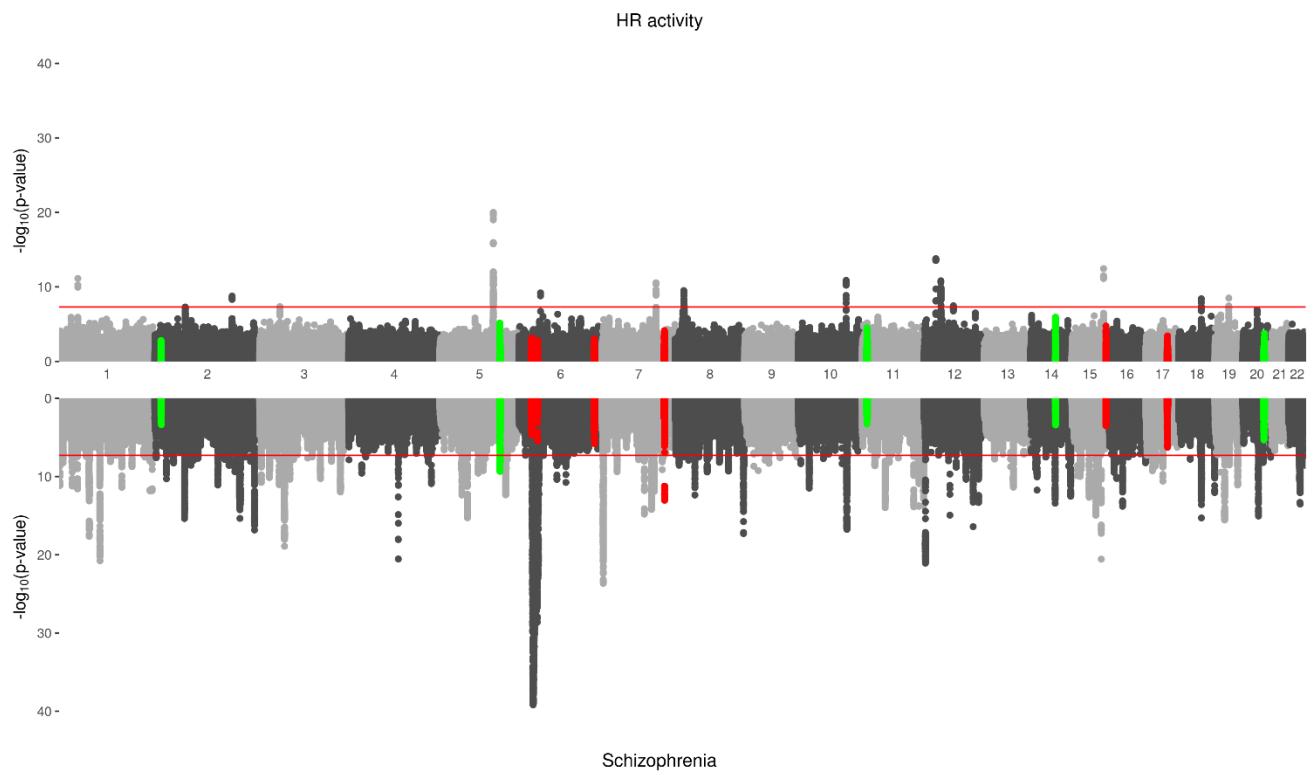

Figure S4. Miami plots for the heart rate during activity and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

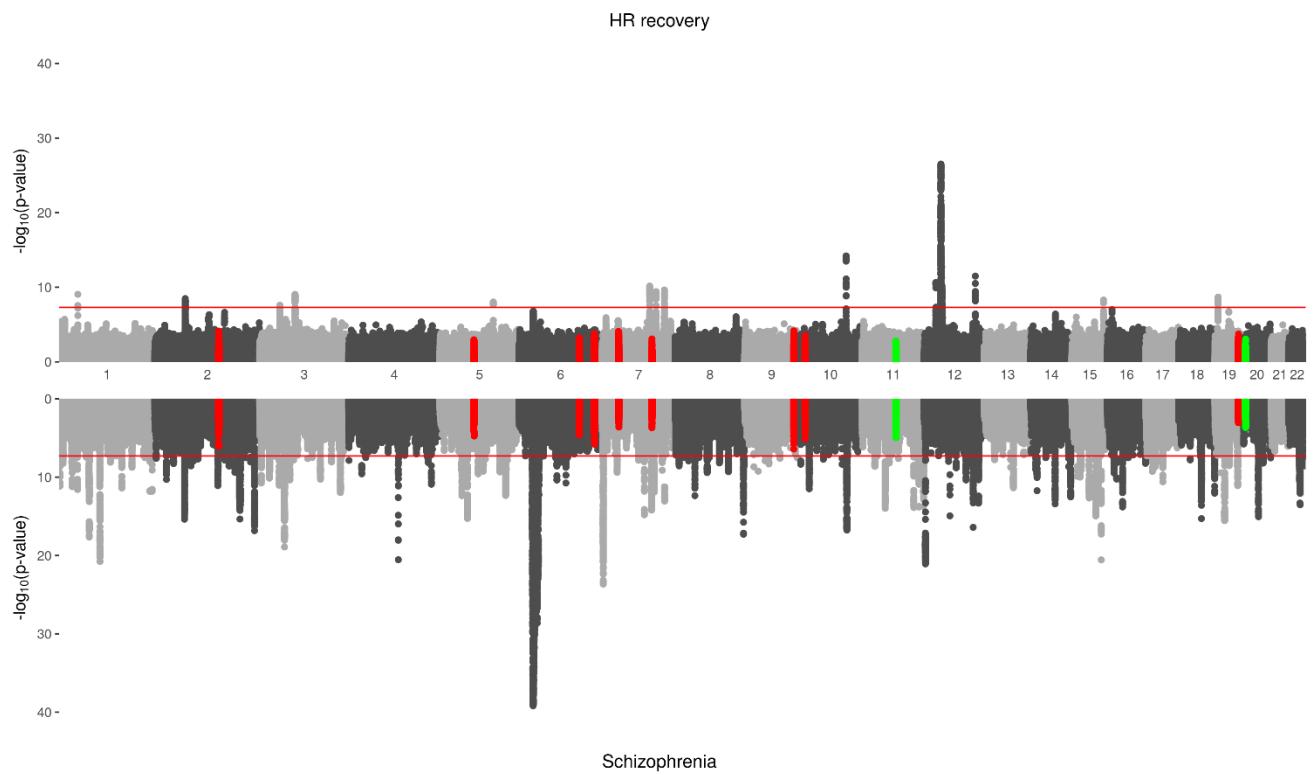

Figure S5. Miami plots for the heart rate during recovery and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

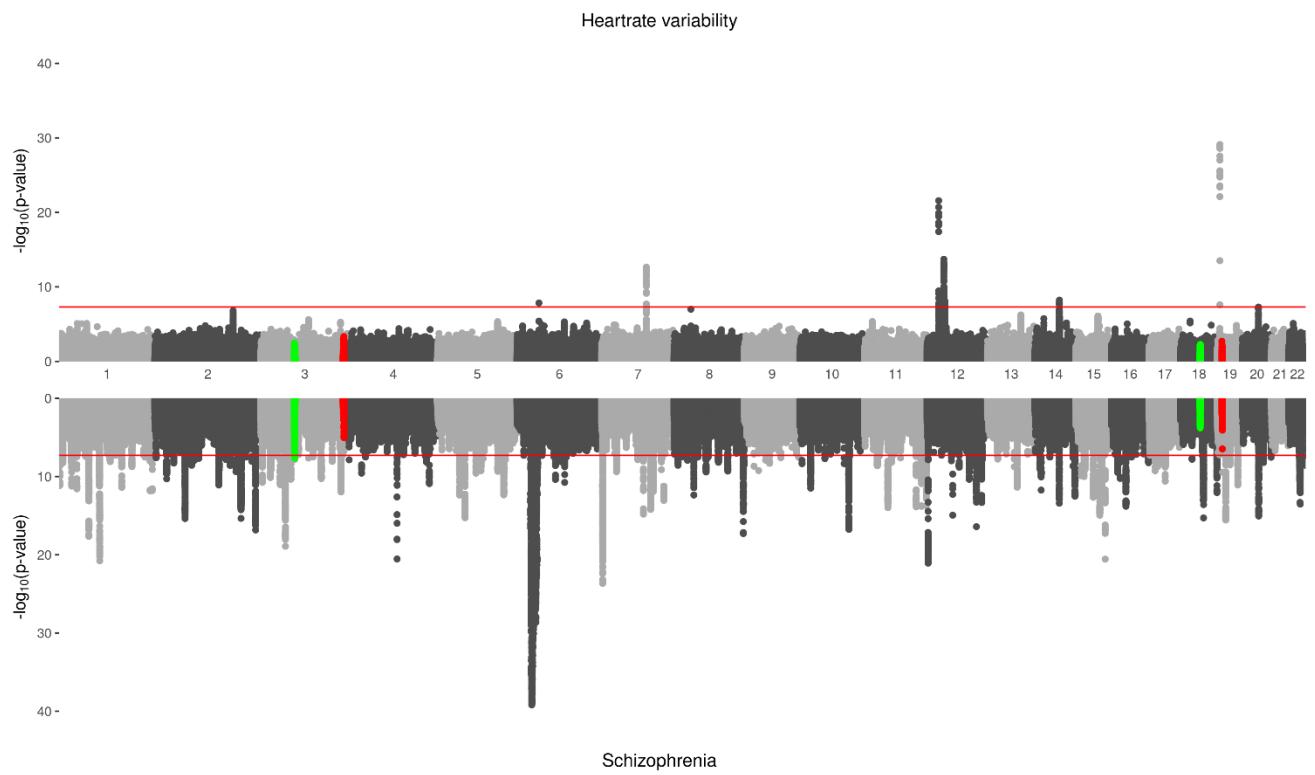

Figure S6. Miami plots for the heart rate variability and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

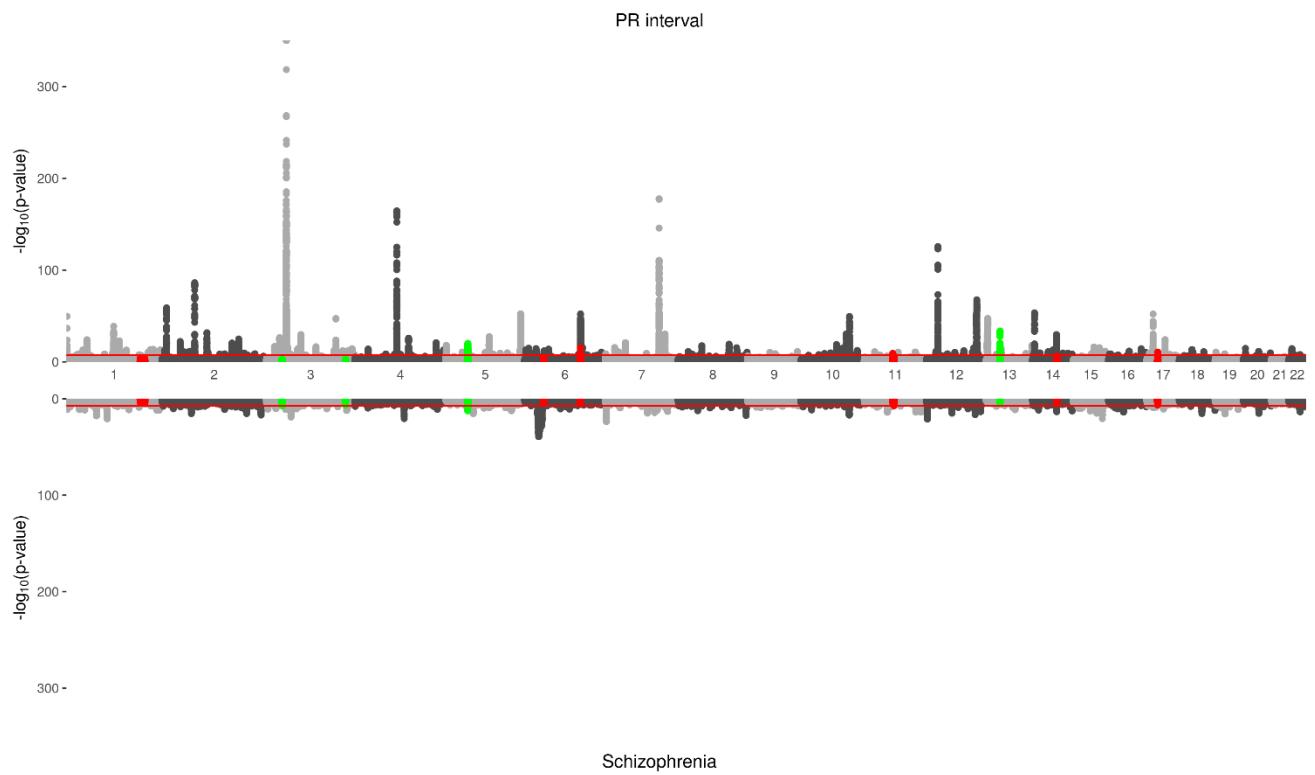

Figure S7. Miami plots for the PR interval and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

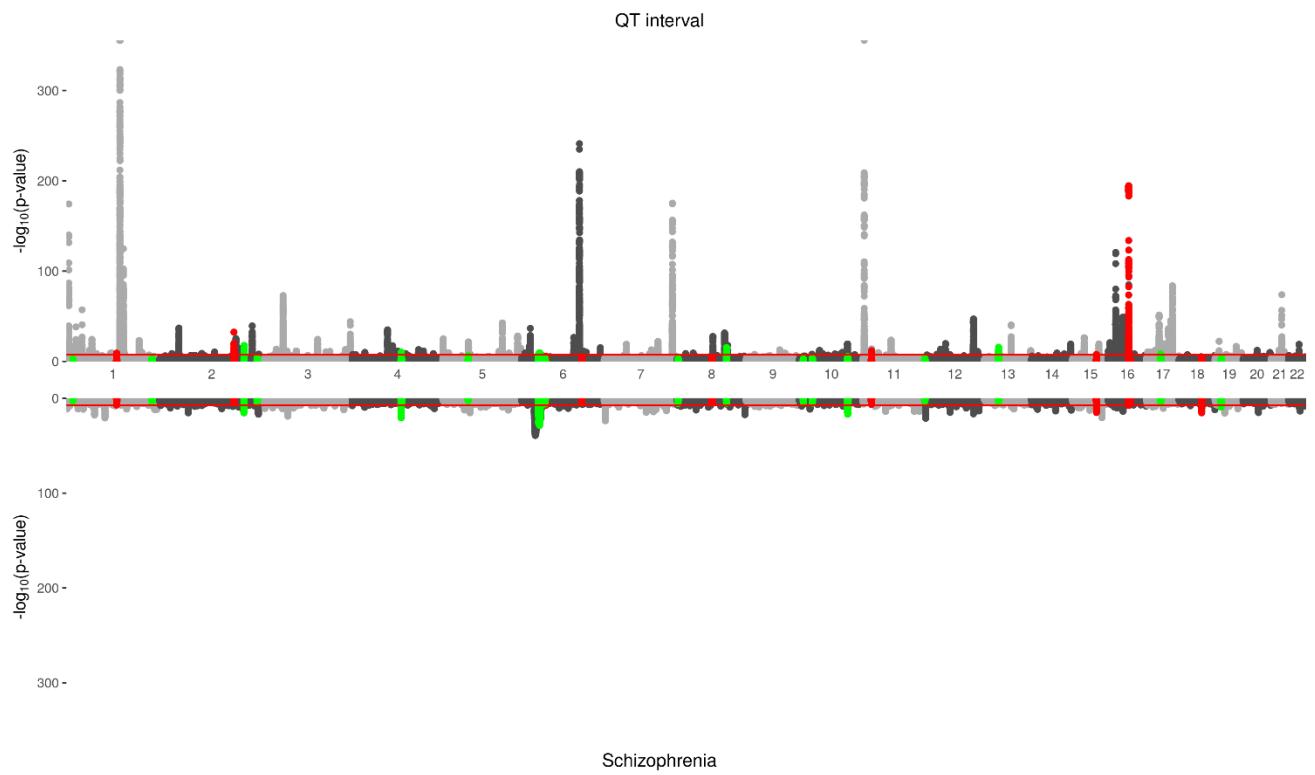

Figure S8. Miami plots for the QT interval and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

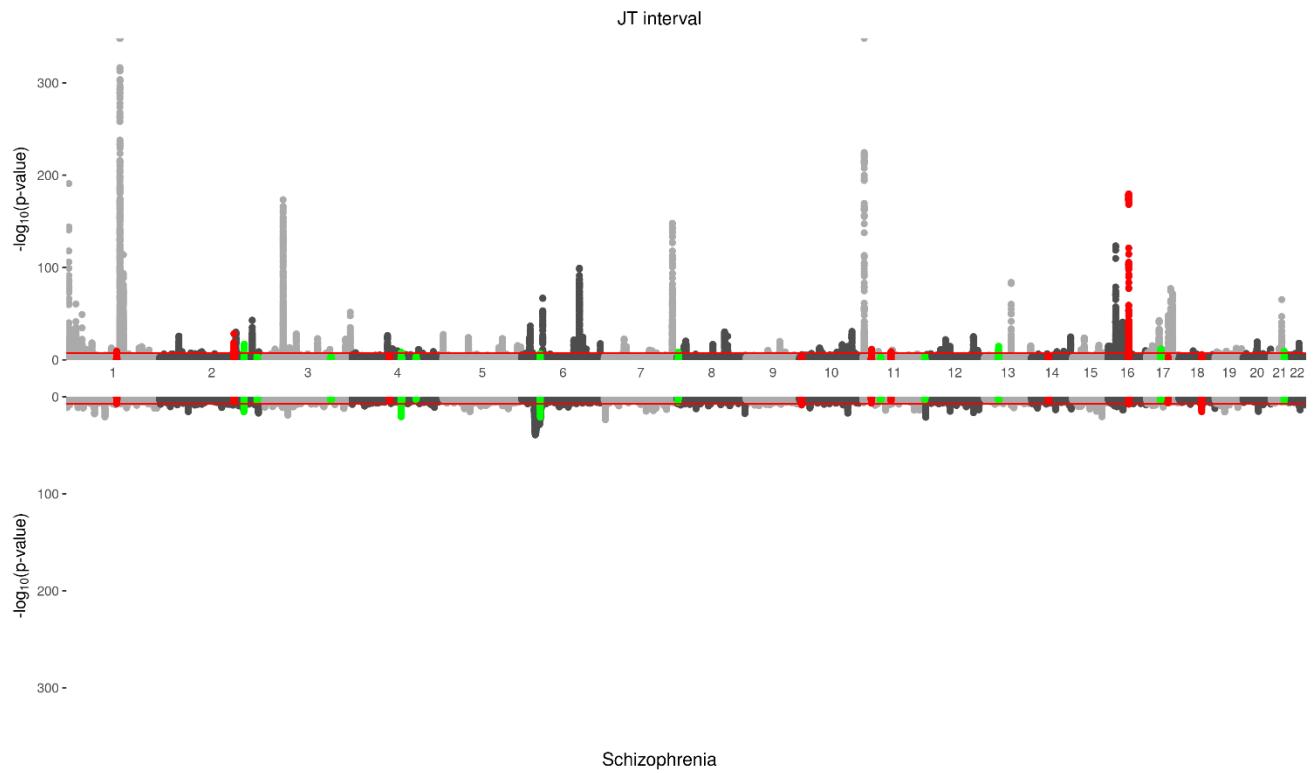

Figure S9. Miami plots for the JT interval and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

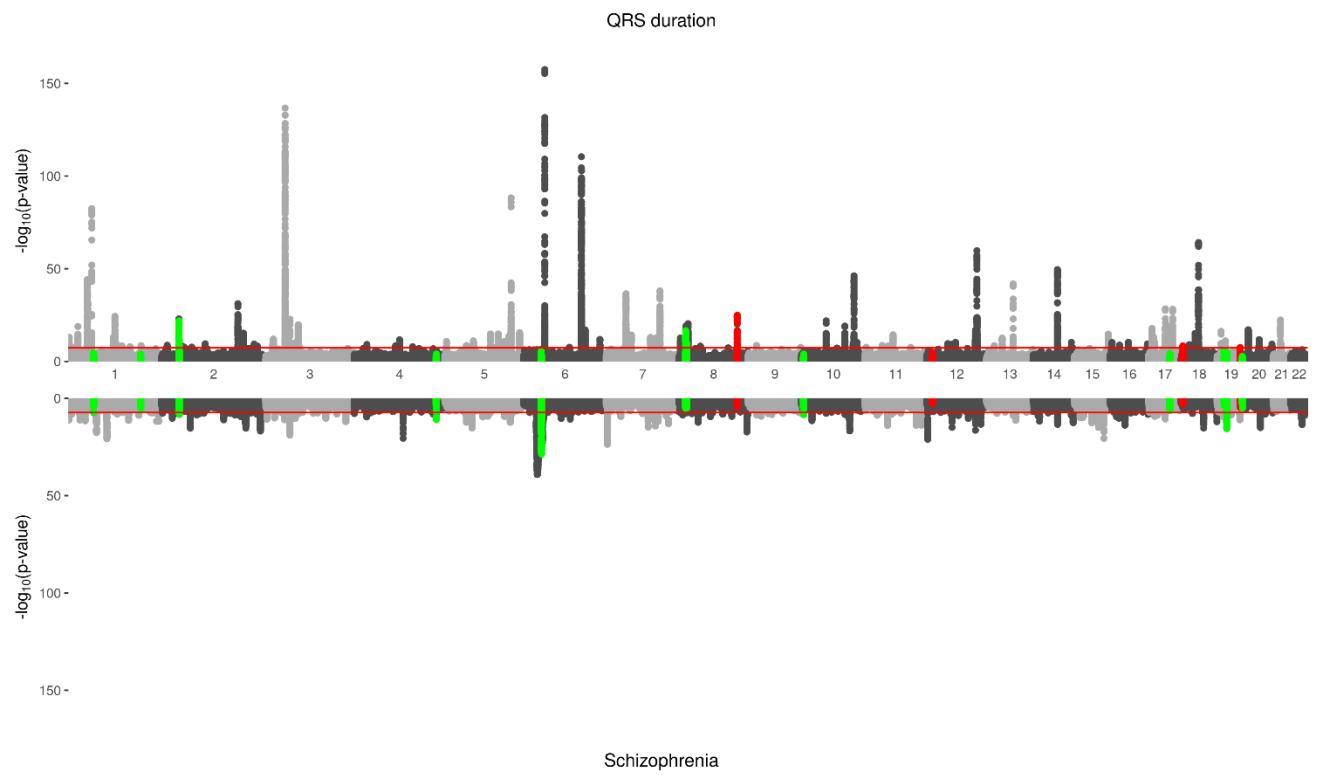

Figure S10. Miami plots for the QRS interval and schizophrenia GWASs. SNPs from LAVA regions that showed significant (FDR-corrected) local genetic correlations are shown in red (correlation was negative) and green (correlation was positive).

Table S1. Global and MAF-stratified genetic correlations of schizophrenia with all cardiac traits

Cardiac traits	Global		MAF 0·05-0·11		MAF 0·11-0·22		MAF 0·22-0·36		MAF 0·36-0·50

2. Functional annotation analyses

A

B

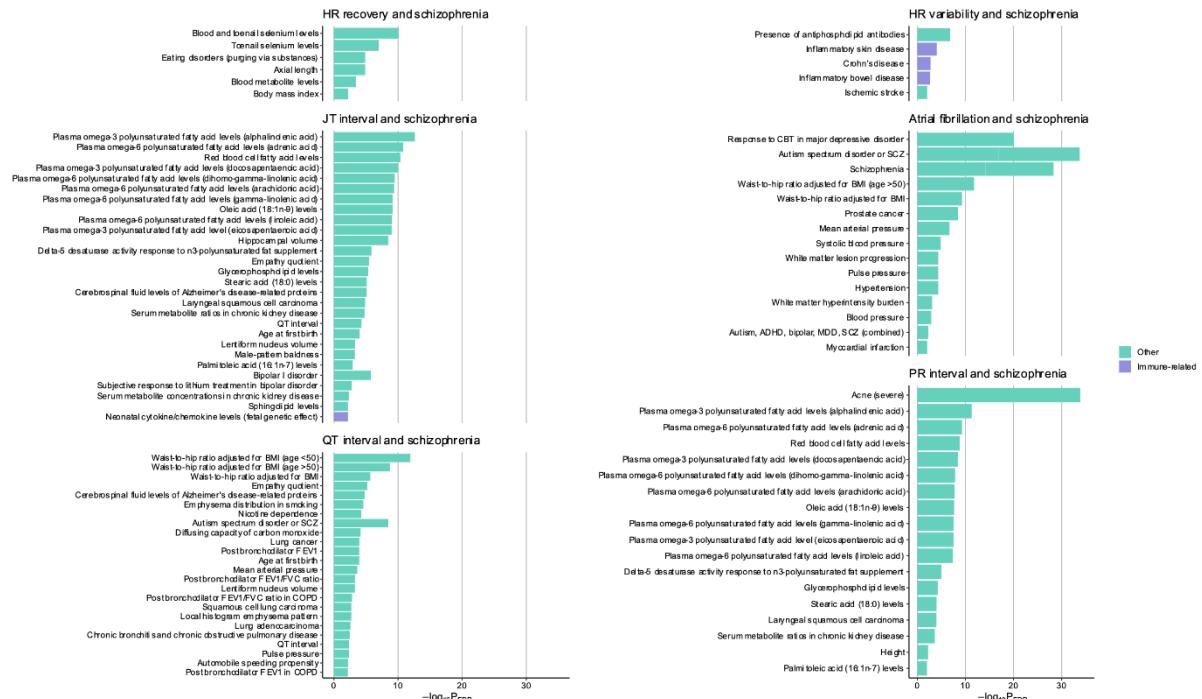

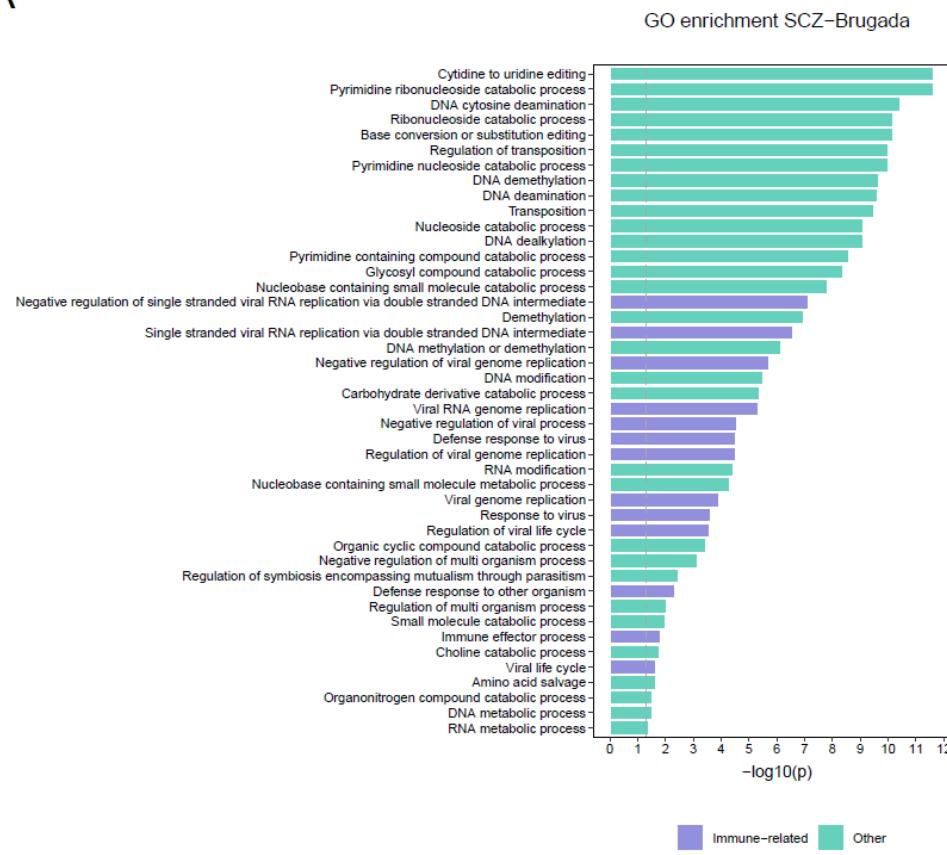

Figure S11. Previously reported trait associations from GWAS catalogue for genes in regions with a significant SCZ-cardiac trait correlation (excluding HLA region). **Panel A)** shows results for genes in regions with a positive SCZ-cardiac trait correlation; **panel B)** shows results for genes in regions with a negative correlation.

A

B

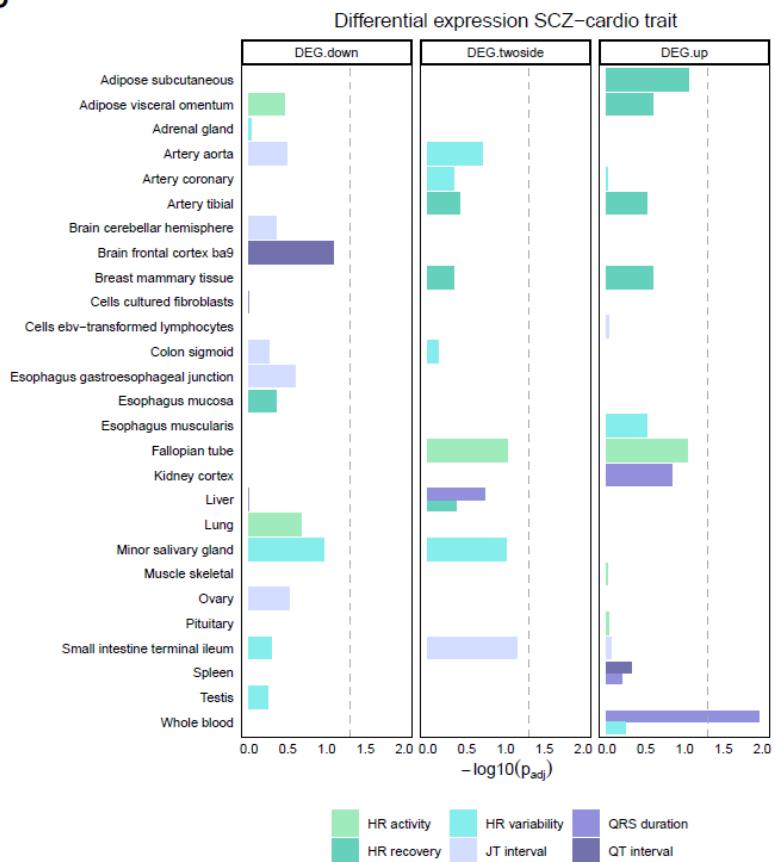

Figure S12. Functional significance of genes in regions that correlate positively between schizophrenia and an arrhythmic disorder or ECG trait. **Panel A** shows significant enrichment (after FDR-correction) in biological process GO terms for all genes in regions with a positive genetic correlation between schizophrenia and Brugada. GO terms that are primarily related to viral response and immune processes are highlighted in purple. **Panel B** shows differential tissue expression (downregulation, upregulation, and combined, at marginal $p<.05$) for genes in regions that showed a positive genetic correlation between a schizophrenia and a cardiac trait pair. The x-axes in both panels show the log-transformed p-value after FDR-correction, with the dashed lines indicating the significance threshold ($p_{FDR}<.05$).

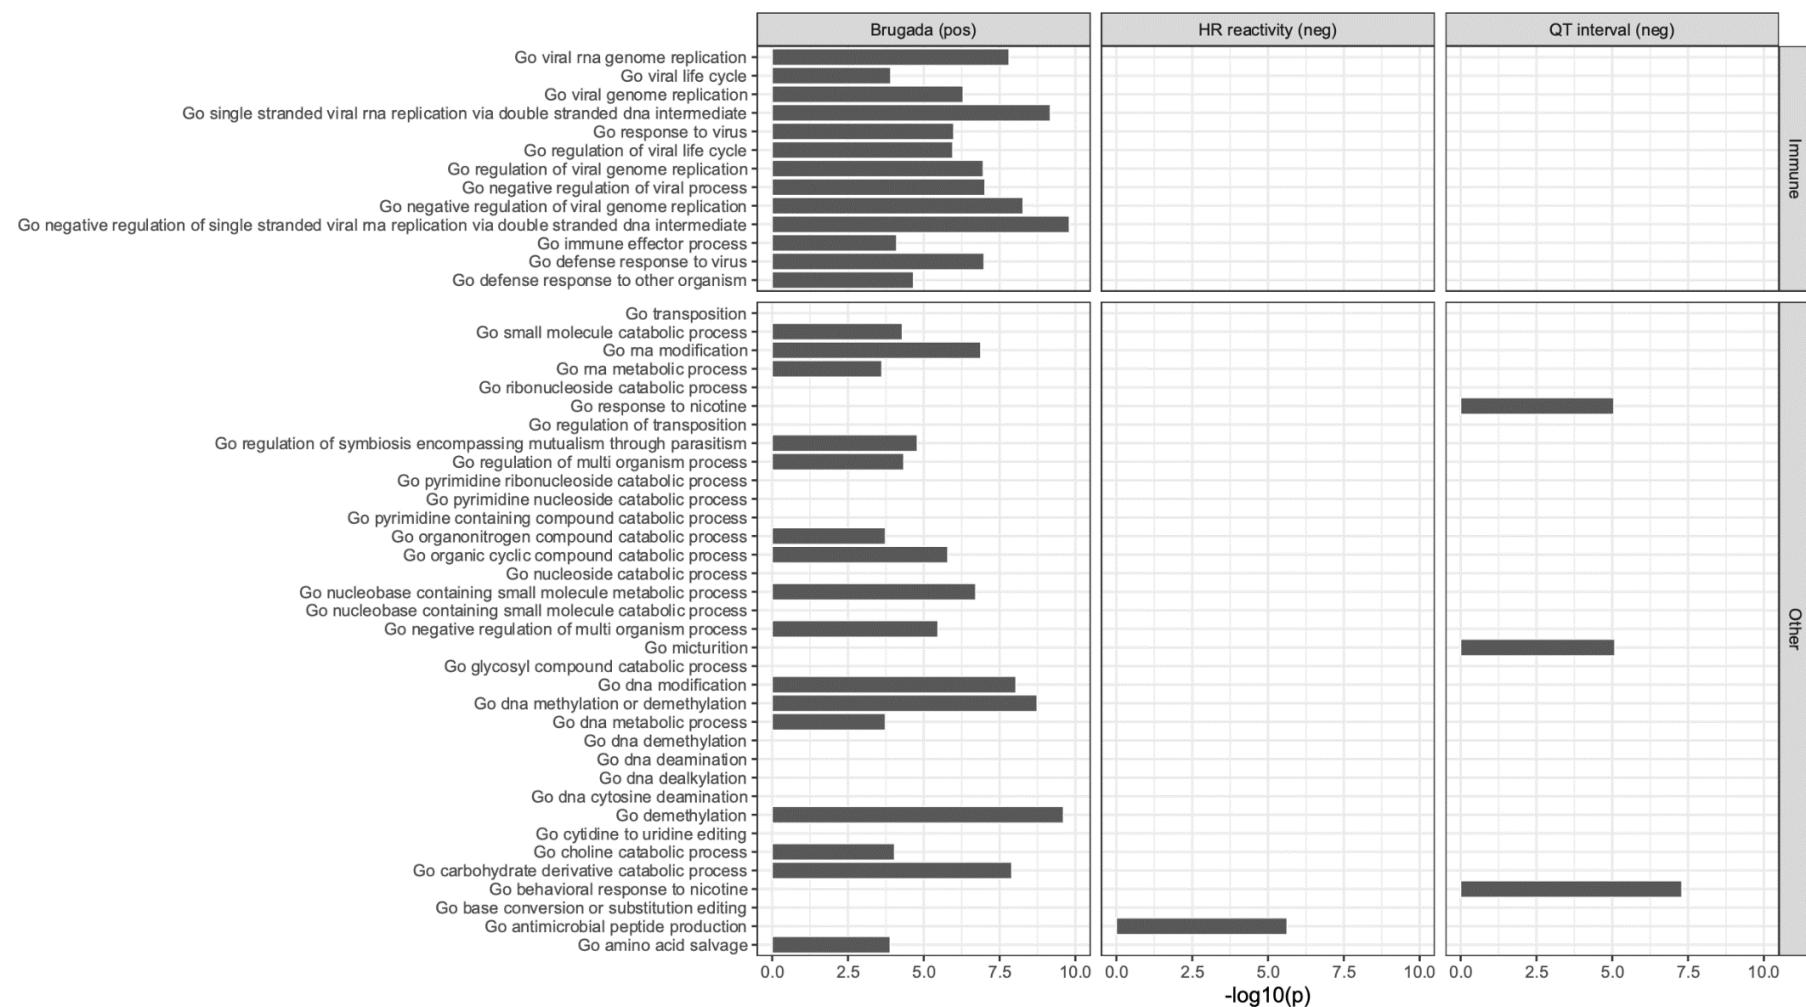

Figure S13 Full results of GO biological processes enrichment for genes in regions with a significant SCZ-cardiac trait association (excluding HLA region). Only results for trait pairs with any significant enrichment are plotted. Results for processes associated with immune function or viral response (from different GO branches) are shown at the top.

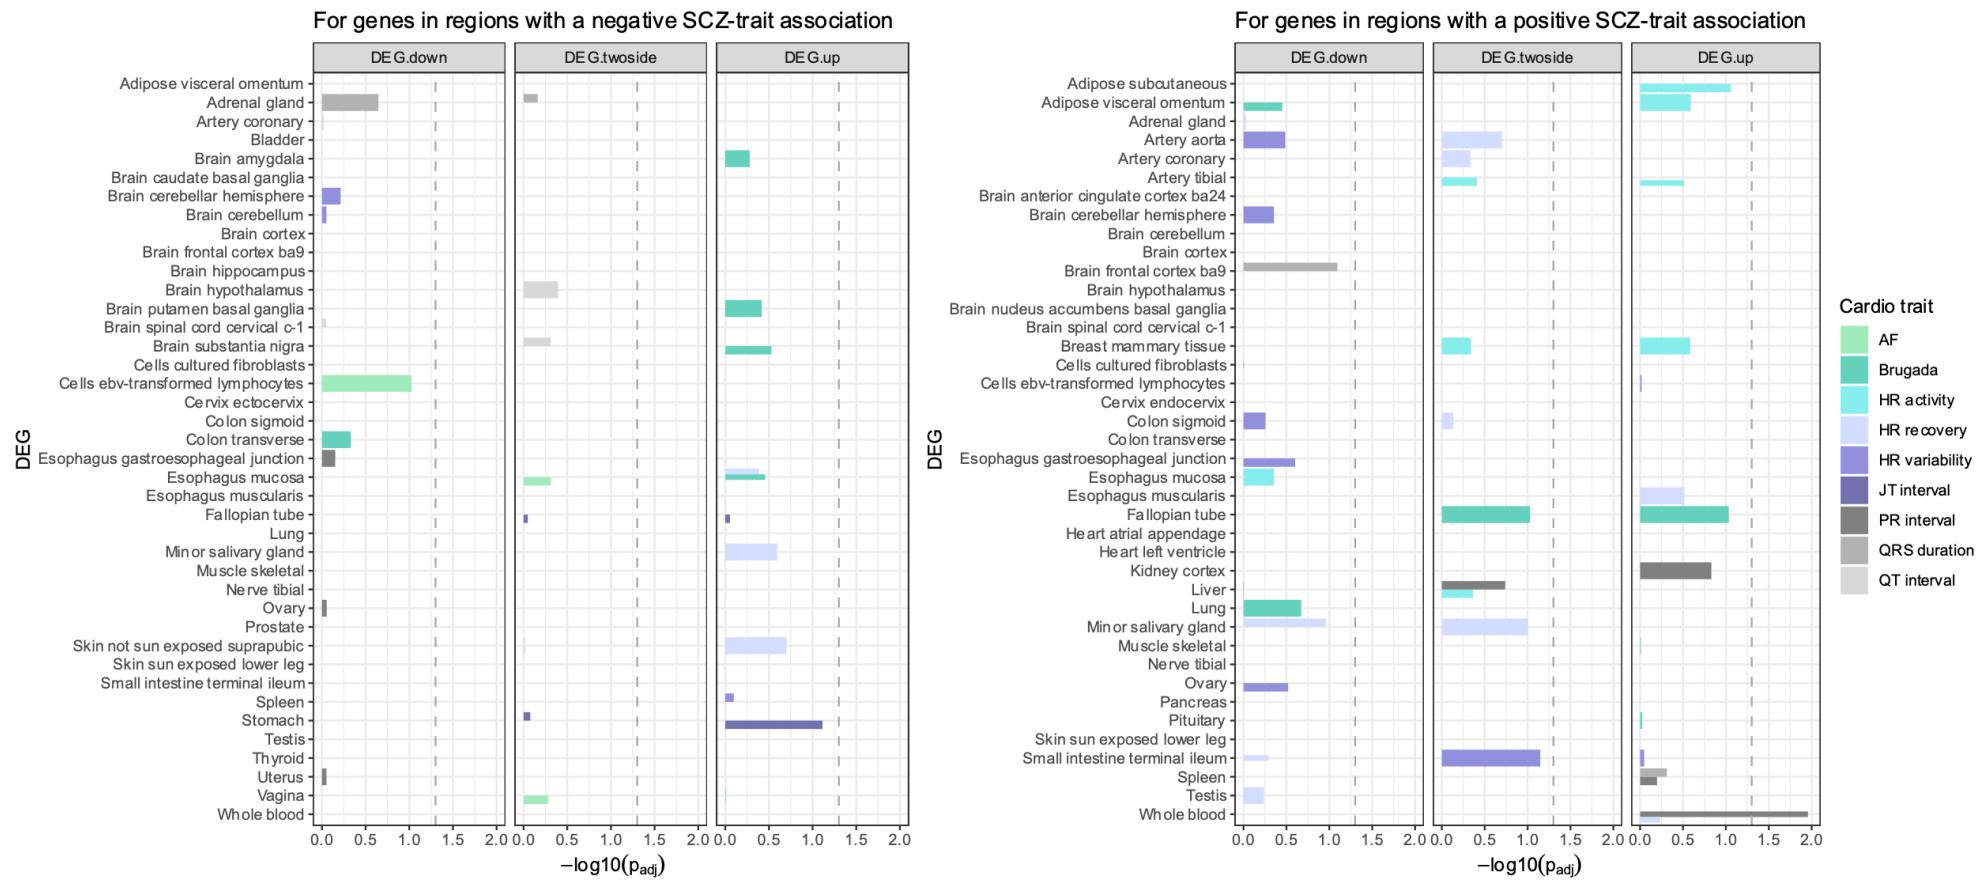

Figure S14. Full results for differential tissue expression across the 30 available tissue types of the GTEx project for genes in regions with a significant SCZ-cardiac trait association (excluding HLA region), with the left panel showing results for genes in negatively associated regions, and the right panel for genes in positively associated regions.

3. Mendelian randomization analyses

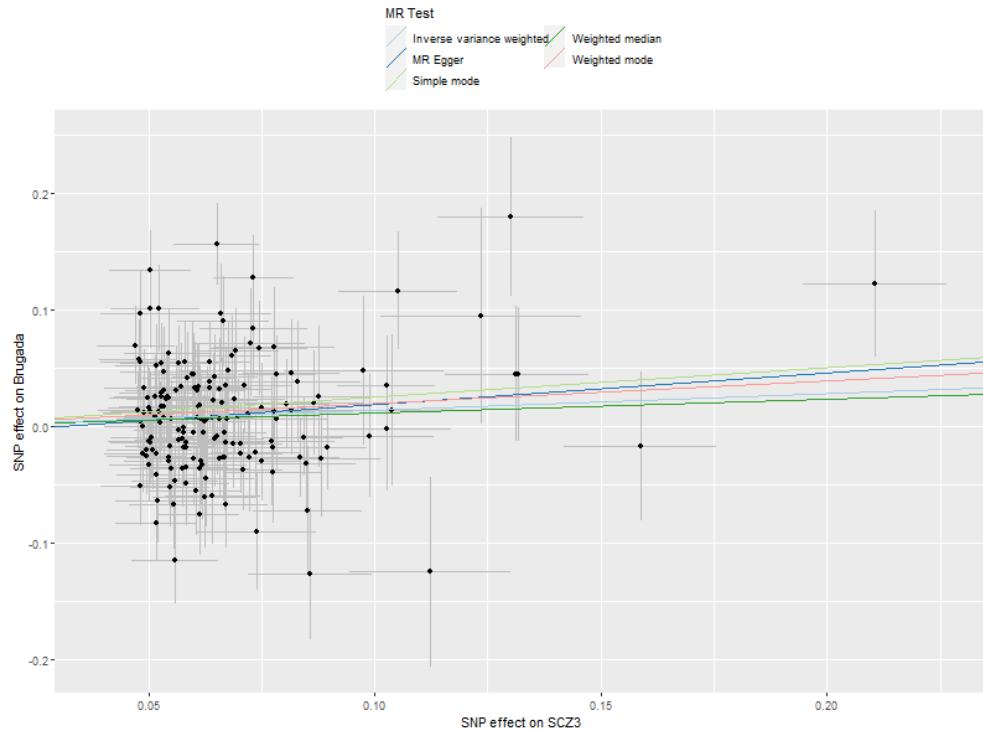

Figure S14. Scatter plot for the Mendelian randomization results with liability to schizophrenia as the exposure and Brugada syndrome as the outcome.

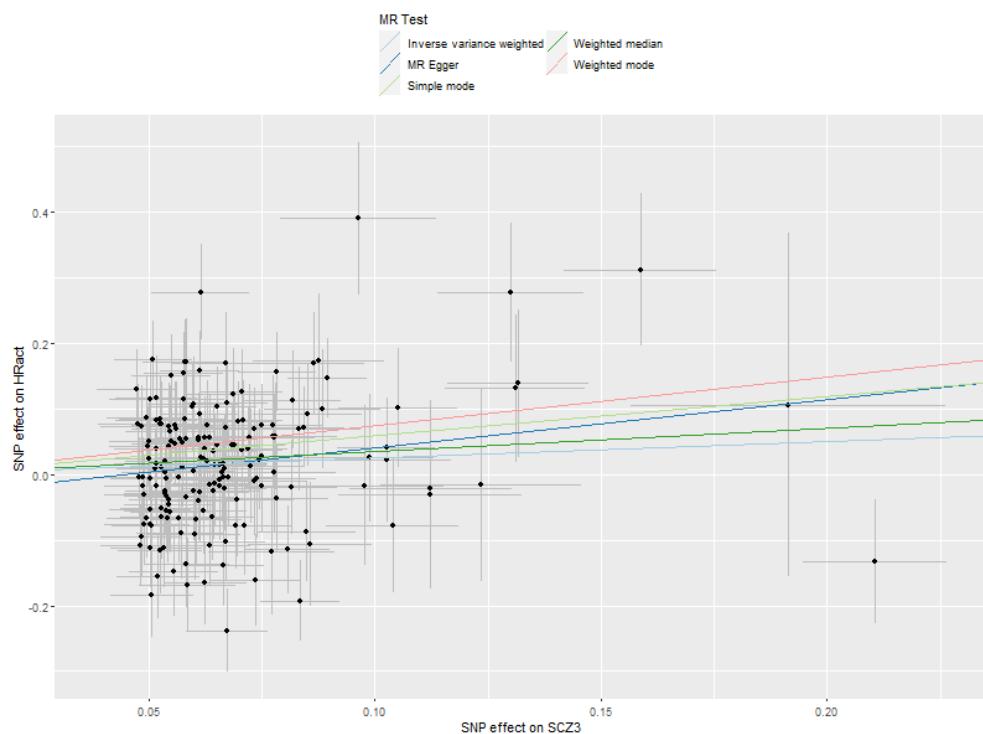

Figure S15. Scatter plot for the Mendelian randomization results with liability to schizophrenia as the exposure and heart rate during activity as the outcome.

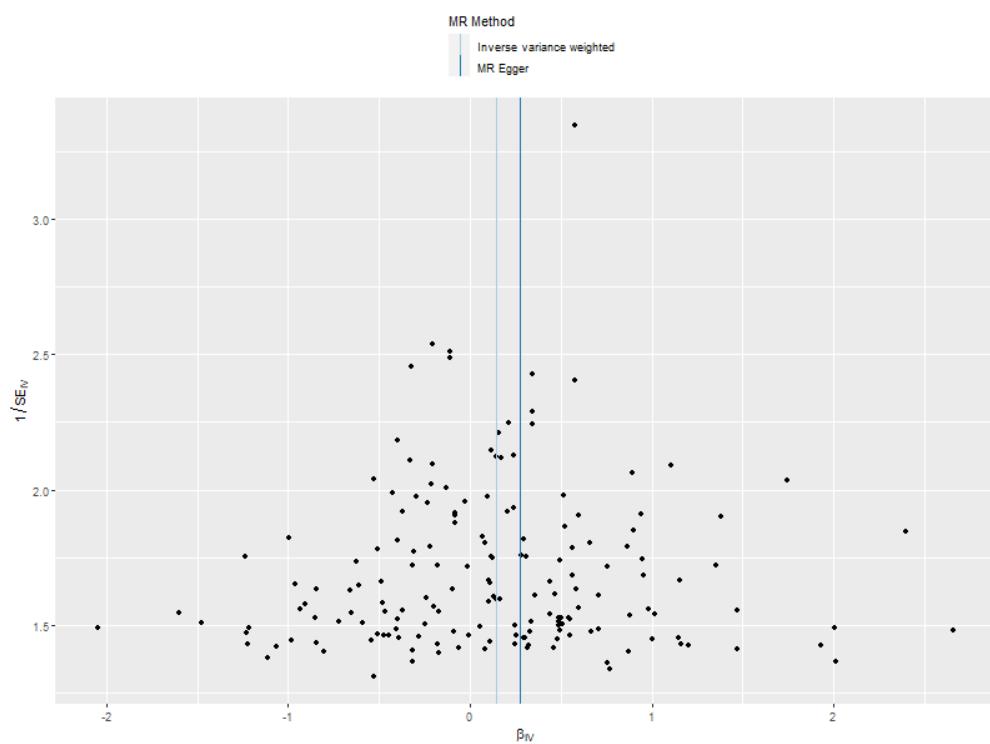

Figure S16. Funnel plot for the Mendelian randomization results with liability to schizophrenia as the exposure and Brugada syndrome as the outcome

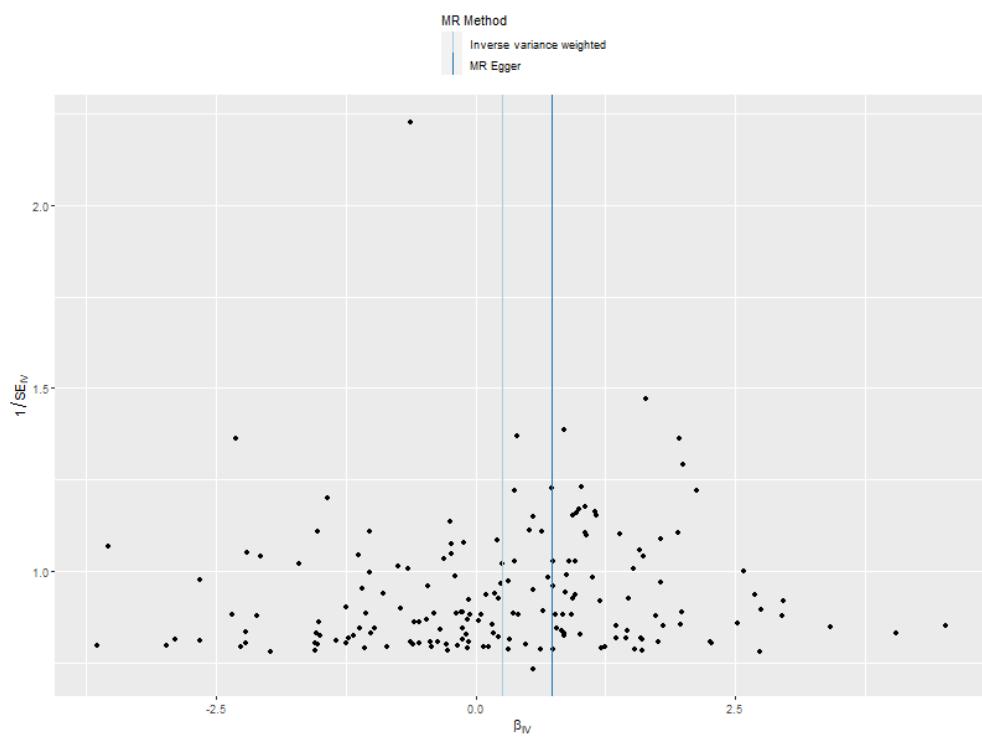

Figure S17. Funnel plot for the Mendelian randomization results with liability to schizophrenia as the exposure and heart rate during activity as the outcome.

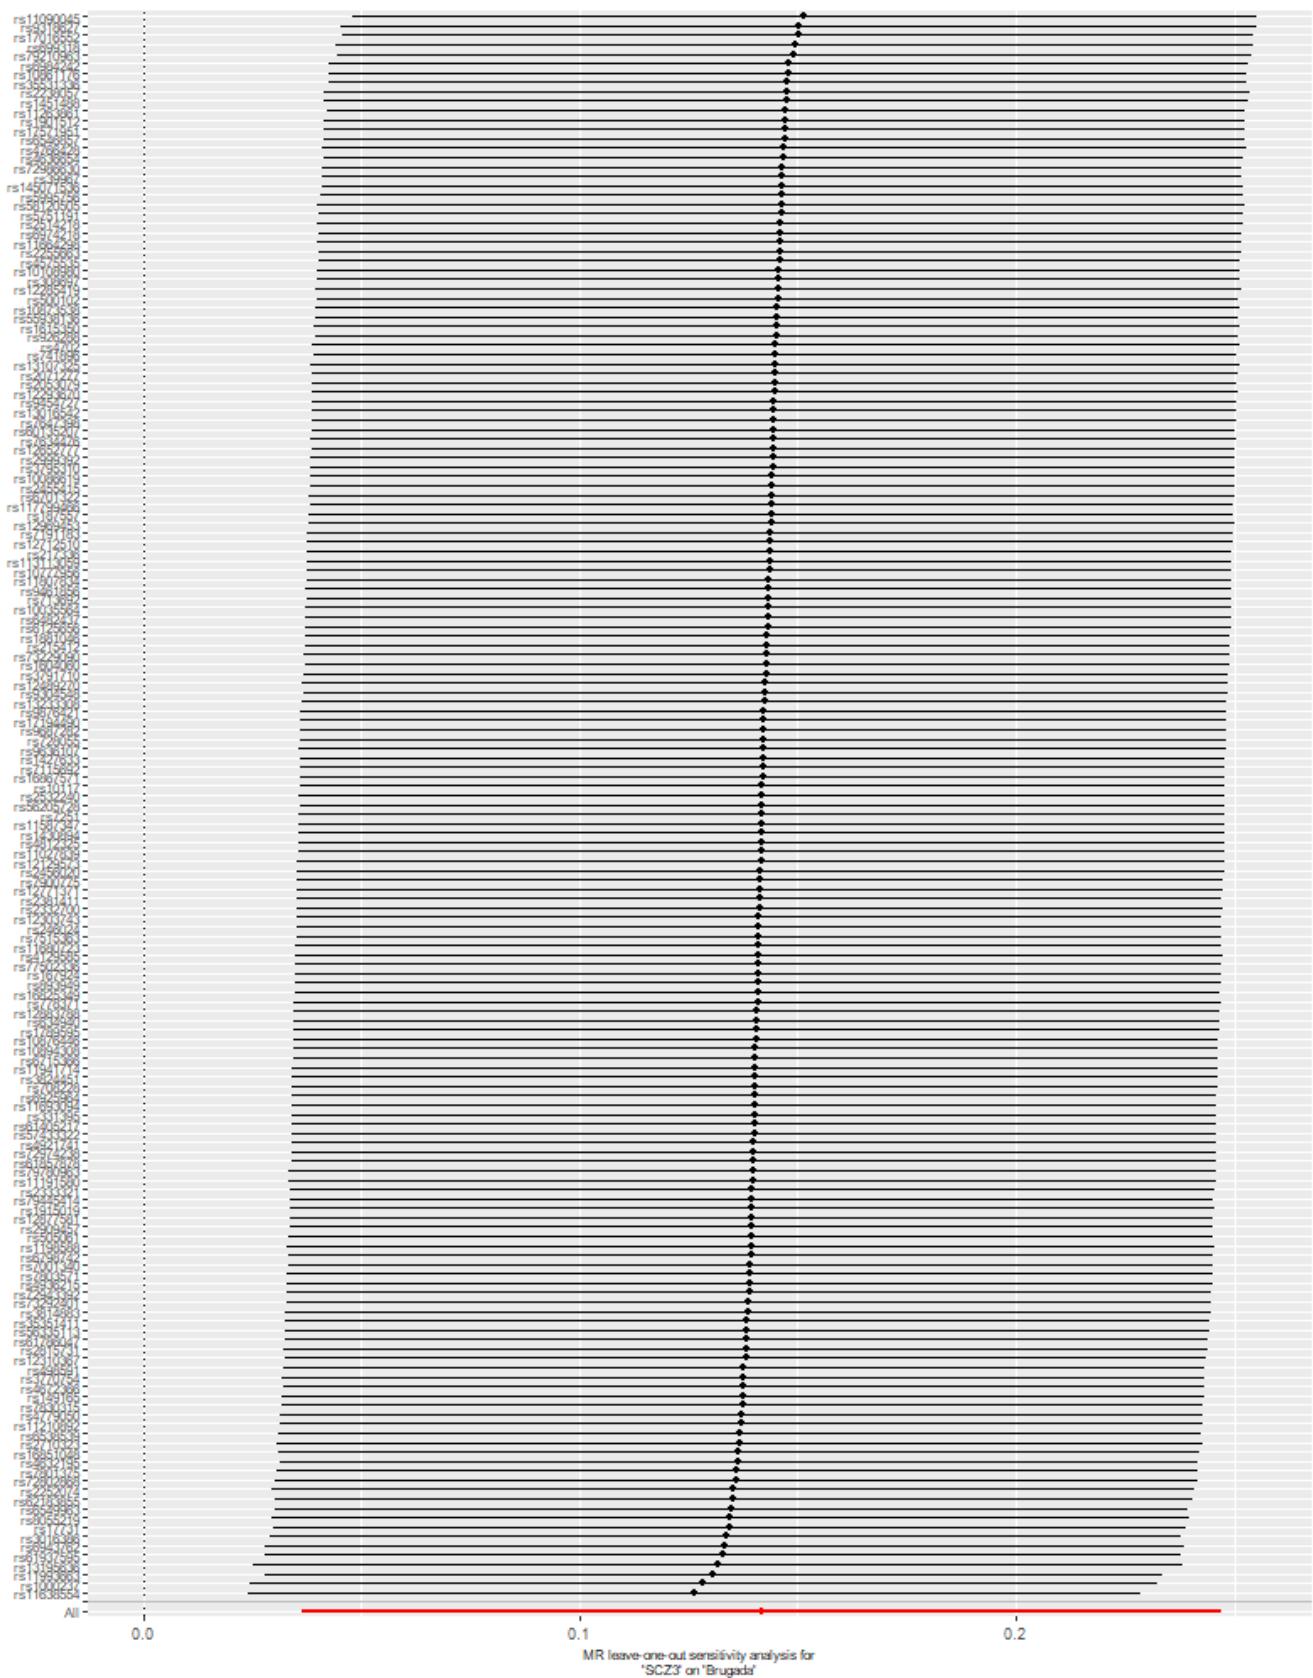

Figure S18. Leave-one-out analysis for the Mendelian randomization results with liability to schizophrenia as the exposure and Brugada syndrome as the outcome.

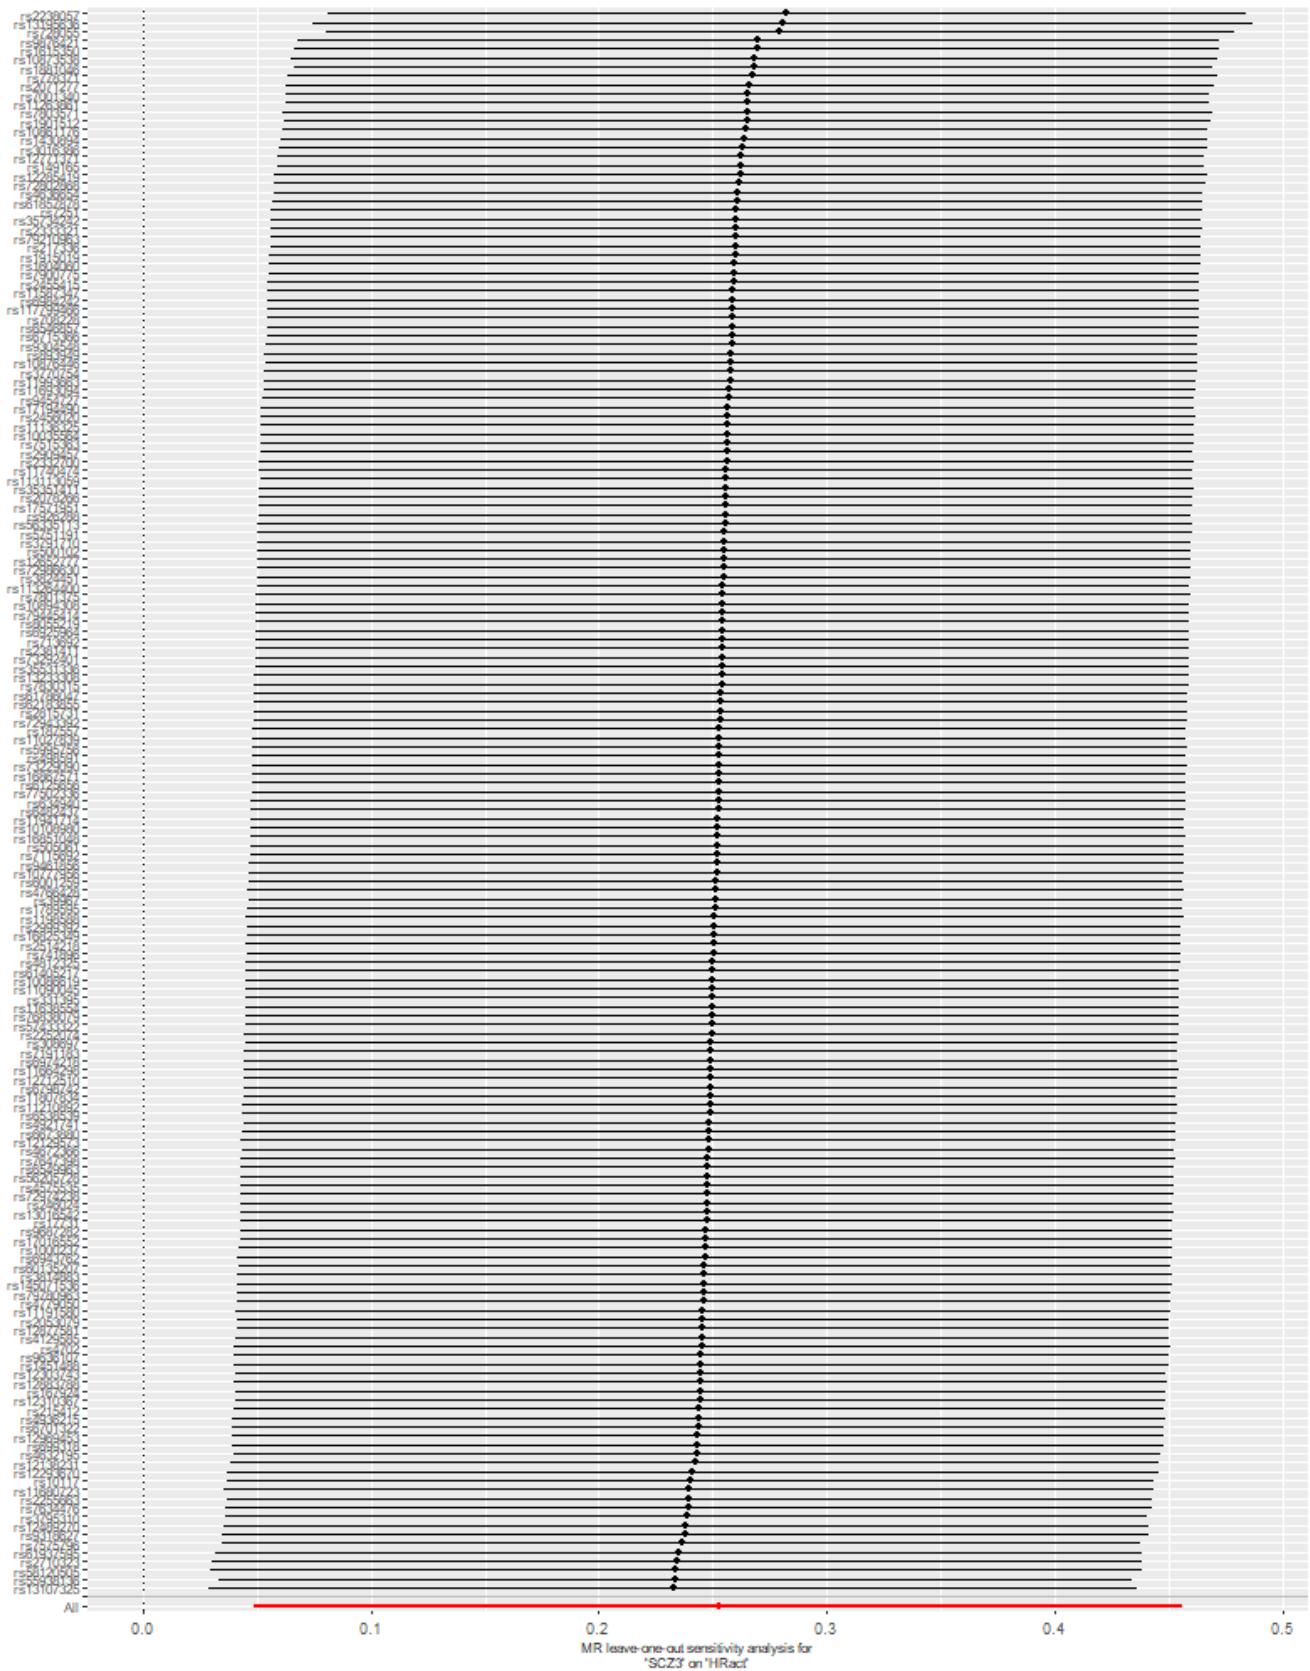

Figure S19. Leave-one-out analysis for the Mendelian randomization results with liability to schizophrenia as the exposure and heart rate during activity as the outcome

Table S3. Test for heterogeneity with Cochran's Q statistic for all univariable MR analyses

Exposure	Outcome	Method	Q	df	P value
Schizophrenia	AF	IVW	280.14	151	8.7E-10
		MR Egger	279.72	150	6.9E-10
Schizophrenia	Brugada	IVW	243.44	168	1.2E-04

		MR Egger	251.81	98	1.7E-15

Table S4. Multivariable Mendelian randomization

Exposure	Outcome	Additional exposure	IVW beta (95% Cis), p
Schizophrenia	Brugada		0.14 (0.03 to 0.25), 0.009
	Brugada	HR activity	0.19 (-0.02 to 0.40), 0.089
	Brugada	HR recovery	0.17 (-0.04 to 0.38), 0.123
	Brugada	HR variability	0.17 (0.03 to 0.31), 0.015
	Brugada	PR interval	0.13 (-0.04 to 0.30), 0.125
	Brugada	QT interval	0.15 (0.01 to 0.29), 0.042
	Brugada	JT interval	0.16 (0.00 to 0.32), 0.042
	Brugada	QRS duration	0.12 (-0.01 to 0.25), 0.076

Note that the Inverse Variance Weighted (IVW) estimate represents the causal effect of liability to schizophrenia on Brugada, before and after adding each of the additional exposures separately.
