Transfection

For leptin or OB-Rb knockdown, transient transfection was performed using siRNA-mate (G04003, GenePharma, Shanghai, China) according to the manufacturer's instructions. Mammary epithelial cells were plated in 6-well plates at 1×10^6 cells/well, ~50% confluent cells were transfected with 20 μM of bovine specific small interfering RNA (siRNA, GenePharma, Shanghai, China), and scrambled siRNA as negative control. The siRNA sequences used are shown in Table S1. To detect the effect of leptin on OB-Rb expression and milk fat synthesis, cells were transfected with OB-Rb or SREBP1 RNAi and with or without the addition of 200 ng/mL leptin for 24 h. To detect the effect of fatty acid synthesis precursors on leptin and OB-Rb expression, were changed to serum-free medium (1% BSA) with 8 mM acetate and 1 mM BHB before transfection, then transfected with leptin RNAi. All experiments were performed in triplicate. After 24 h of transfection, cells were harvested for quantitative real-time PCR (qRT-PCR). After 48 h of transfection, cells were harvested for western blot analysis and TAG content assays.

Quantitative real-time PCR

The expression levels of leptin, OB-Rb and DEGs randomly screened in transcriptome sequencing were determined by qRT-PCR using gene-specific primers (Table S2). qRT-PCR was performed in the Applied Biosystems 7500 Real-Time PCR system (Applied Biosystems, Gland Island, NY) with 10 μL ChamQ Universal SYBR qPCR Master Mix (Q711-02, Vazyme, Nanjing, China), 100 ng cDNA and 10 pM primers. Thermal cycling conditions were: pre-denaturalization at 95°C for 30 s, followed by 10 s denaturation at 95°C and 30 s annealing and extension at 60°C, repeated 40 cycles. Each gene was amplified in a separate reaction and each reaction was performed in triplicate. The relative expression of target genes was normalized to β -actin and calculated by the $2^{-\Delta\Delta\text{CT}}$ method.

Western blot

The tissues or cells were lysed at 4°C with 1% SDS lysis containing phenylmethylsulfonyl fluoride (PMSF, 0.5 mM, ST506, Beyotime), and divided in 10% SDS-PAGE and transferred to nitrocellulose membrane. Membranes were blocked in 5% skim milk and incubated with primary antibodies Leptin (1:1000 dilution), OB-Rb (1:1000 dilution), AKT (1:1000 dilution, A11016, ABclonal), p-AKT-S473 (1:1000 dilution, AP0140, ABclonal), p-AKT-T308 (1:1000 dilution, AP1259, ABclonal), mTOR (1:1000 dilution, A11355, ABclonal), p-mTOR (1:1000 dilution, AP0115, ABclonal), ACC (1:1000 dilution, 3662S, Cell Signaling Technology, Danvers, MA), p-ACC (1:1000 dilution, 11818T, Cell Signaling Technology), FASN (1:1000 dilution, 3189S, Cell Signaling Technology), SREBP1 (1:200 dilution, sc-17755, Santa Cruz Biotechnology, CA), DGAT1 (1:1000 dilution, A6857, ABclonal) and β-actin (1:10,000 dilution, AC006, ABclonal) at 4°C overnight. After washing, membranes were incubated with anti-rabbit IgG HRP-linked secondary antibody (1:10,000 dilution; ABclonal) at 37°C for 1 h. β-actin was used as an internal control. The blots were then visualized using enhanced chemiluminescent detection reagent (ECL, 180-506, Tanon, Shanghai, China), and then quantified via ImageJ (Media Cybernetics Inc., Warrendale, PA).
