Robustness Checks Using Alternative Specifications.

These tables report robustness tests using alternative empirical specifications for the main analysis. The specifications are similar to those reported in Table 3 Panel A except for the following changes. Table IA.1 replaces the continuous *Tariff Exposure* measure with a binary variable, *High Tariff Exposure*, equal to one for industries in the top tercile of the distribution and zero for industries in the bottom tercile; industries in the middle tercile of the *Tariff Exposure* distribution are excluded from the analysis. Table IA.2 supplements the main sample with observations from nonmanufacturing industries in the CRSP-Compustat Merged Database; the sample construction process and empirical specification is identical to Table 3 Panel A except that nonmanufacturing industries are included and are coded as having zero *Tariff Exposure* and zero *Unskilled Labor Share* because these variables only pertain to manufacturing industries. Table IA.3 reports estimates from regressions with no fixed effects; the constituent terms *Post*, *Tariff Exposure*, *Tech Industry*, and *Unskilled Labor Share* have estimable coefficients because the regressions do not contain perfectly colinear industry or year dummy variables, unlike in the main analysis. Table IA.4 reports estimates from regressions with sector fixed effects that are broader than 6-digit NAICS industries, as shown in Figure 2, and therefore are not perfectly colinear with the constituent terms. Table IA.5 repeats the main analysis using Poisson regressions and a count dependent variable rather than using OLS and a logged dependent variable. Appendix 1 lists variable definitions.

Table IA.1: Robustness Test Using a Binary Measure of Tariff Exposure

	Ln(Number of Listed Firms)			Compustat HHI		
	1	2	3	4	5	6
Post	-35.57*** (3.49)			9.67*** (1.49)
