

Online Appendix

A Additional Materials

The tables in this appendix show the summary statistics of the variables used followed by cointegration, stationarity and tests of exogenous conditioning.

The figures are related to robustness exercises shown in the main IRF exercises.

Table A.1: Descriptive Statistics

	Mean	Median	Max	Min	Std. dev.	Mean	Median	Max	Min	Std. dev.
	<i>y</i>					<i>e</i>				
Canada	4.54	4.58	4.98	4.03	0.29	-4.33	-4.25	-3.64	-4.87	0.33

Figure A.4: US green patent shock and responses of stock markets (varying bilateral trade, 1980-2022)

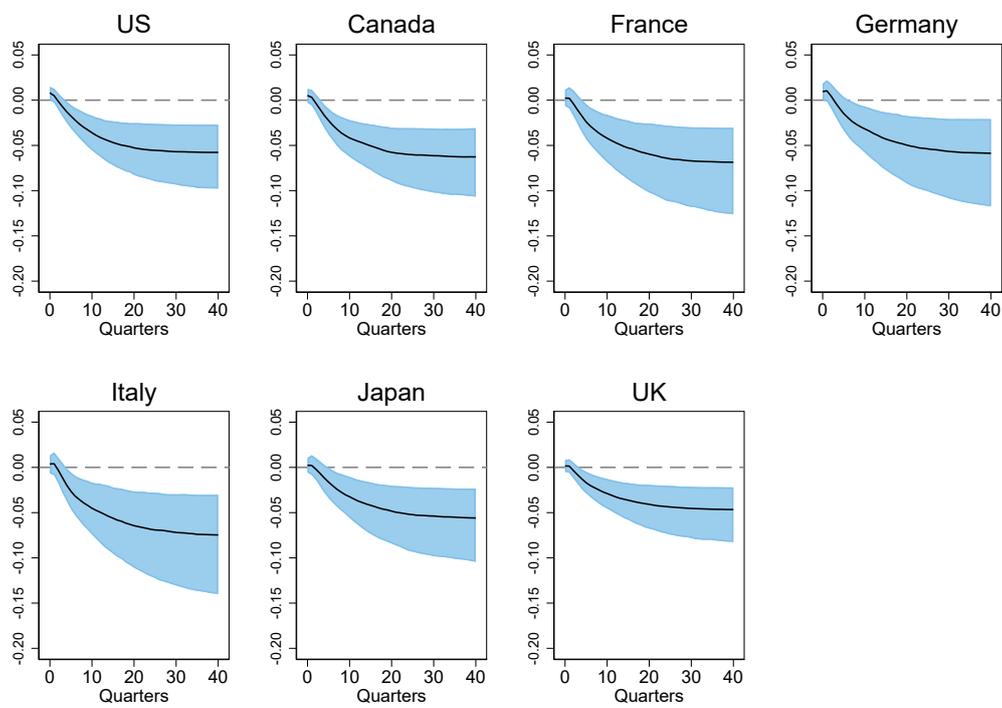

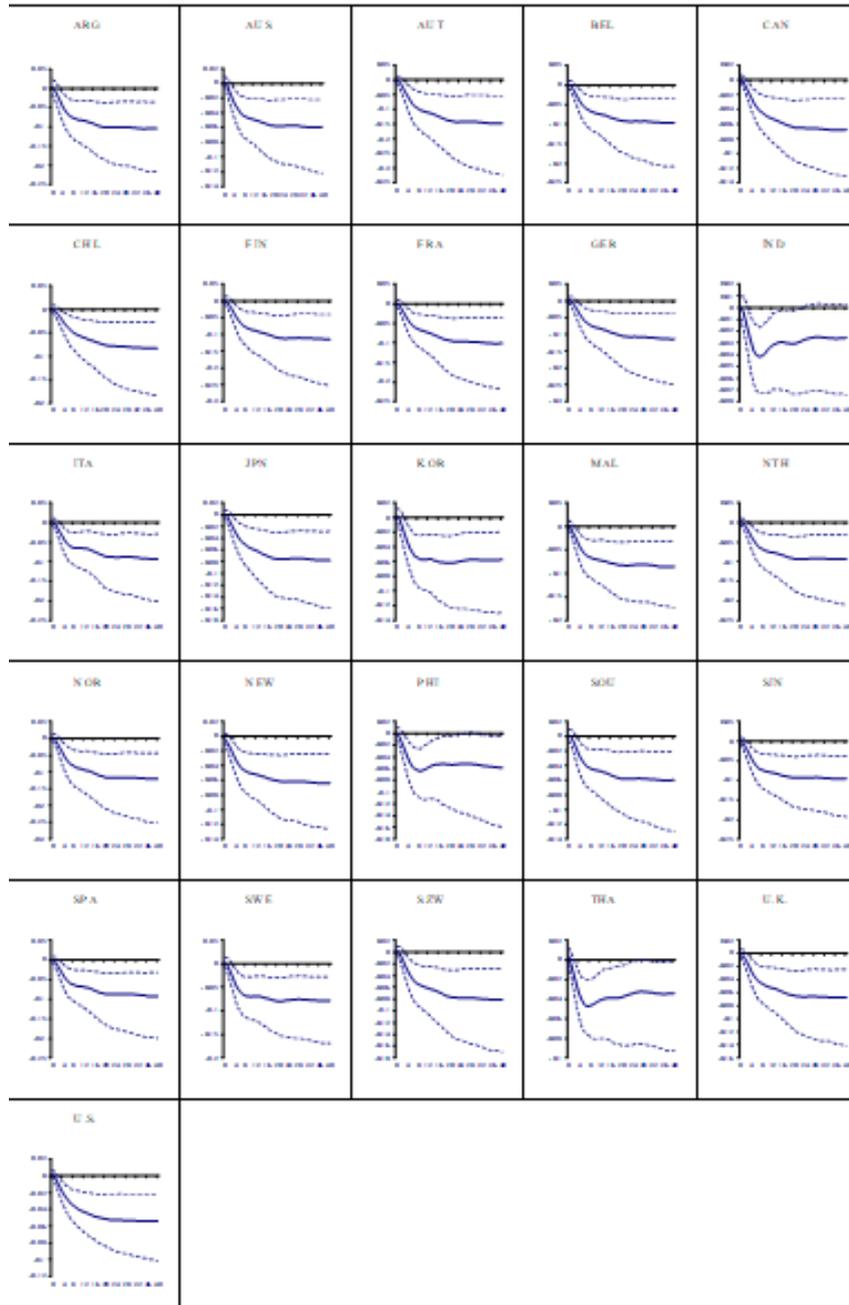

Figure A.5: Generalized Impulse Responses of a US green patent shock and responses of stock markets (model with 33 countries)

B Impulse Responses

B.1 Generalized Impulse Response Functions

We present the GIRF from equation (25), which showed the solution of the GVAR. Thus, GIRFs are defined as,

$$GIRF(x_t; \varepsilon_{ilt}, n) = \mathbb{E}(x_{t+n} | \varepsilon_{ilt} = \sqrt{\sigma_{ii, \ell \ell}}, \mathcal{I}_{t-1}) - \mathbb{E}(x_{t+n} | \mathcal{I}_{t-1}) \quad (\text{B.1})$$

where \mathcal{I}_{t-1} is the information set at time $t - 1$; $\sigma_{ii, \ell \ell}$ is the diagonal element of the variance covariance matrix Σ_ε corresponding to the ℓ^{th} equation in the i^{th} country, n is the horizon, and x_t is the vector with all domestic variables.

Assuming that the error terms follow a multivariate normal distribution, we can rewrite the GIRF in its final form:

$$GIRF(x_t; u_{lt}, n) = \frac{e'_j A_n G_0^{-1} \sum_\varepsilon e_l}{\sqrt{e'_l \sum_\varepsilon e_l}}, \quad n = 0, 1, 2, \dots; l, j = 1, 2, \dots, k \quad (\text{B.2})$$

where G and A are the matrices taken from equation (25), $e' = (0, 0, \dots, 0; 1, 0, \dots, 0)'$ is a selection vector with unity as the ℓ^{th} element in the case of a country-specific shock. GIRFs are invariant to the ordering of the variables but are not strictly speaking structural shocks since they allow for correlation of the error terms (the error terms are not orthogonal).

B.2 Structural Generalized Impulse Response Functions

Generalized IRFs do not identify shocks in any strictly structural or causal sense. We overcome this limitation by using the Structural Generalized IRF (SGIRF). Consequently, we can order the shock following an economic rationale. For the above model let the structural shocks be given by $v_t = P\varepsilon_t$. The identification conditions using the recursive identification approach of Sims (1980) and thus matrix P is lower triangle. See Smith and Galesi (2017) for a more detailed description.
