F-Test	0.000	0.003	0.000	0.001	0.014
N	181	159	136	121	94

Estimation method: Probit. Dependent variable: Binary indicator for the presence of a third party. Heteroskedasticity-robust standard Errors in brackets. Significance levels: \* $p < 0.10$ , \*\* $p < 0.05$ , \*\*\* $p < 0.01$ . Quadratic specification for the regression presented in Table 6 of the manuscript. The mostly insignificant coefficients hint at the linear specification being more suitable.

Table A1: Relationship between the number of cartelists and the presence of a third party

Group	Obs.	Mean	Std. Err.	Std. Dev.	90% Conf. Int.
$\mathbb{1}_{Third\ Party} = 0$	162	5.590	0.372	4.733	4.975 6.205
$\mathbb{1}_{Third\ Party} = 1$	14	8.493	1.852	6.928	5.214 11.772
Combined	176	5.821	0.375	4.981	5.200 6.442
Difference		-2.903	1.889	-6.228	0.423
$H_0 : \text{diff} = 0$				Satterthwaite's degrees of freedom	= 14.068
$H_{alt} : \text{diff} < 0$				$H_{alt} : \text{diff} \neq 0$	
$Pr(T < t) = 0.073$				$Pr( T  >  t ) = 0.147$	$Pr(T > t) = 0.927$

Two sample T-test with unequal variances to account for the variation in variance between cartels without and with an involved third party (see also Ruxton, 2006, for the application of the ‘unequal variance’ T-test). An alternative to the t-test is the nonparametric Mann-Whitney U Test (1947). It requires less functional form assumptions than the t-test and leads to test statistic of  $z = -1.805$ , which corresponds to a p-value of  $p = 0.0711$  for the full sample.

Table A2: Cartel duration and the presence of a third party: Full sample

## Appendix B: Jackknife Standard Error Computation

<i>Dependent variable: Cartel duration in years</i>
