## R-Script for Depression Model

```
# Alleviating the Burden of Depression:
# A Simulation Study on the Impact of Mental Health Services

# Wilhelm, M., Bauer, S., Feldhege, J., Wolf, M., & Moessner, M.
# Center for Psychotherapy Research, Heidelberg
# Contact: Maximilian.Wilhelm@med.uni-heidelberg.de

# 0 - General Comments -----
# The Set-name "set01001" sets the seed for the simulation. If further cases are to be calculated in
# parallel, this R-file can be named "set01002", for example.

# Running the code in Section 3-5:
# 1) The settings must be adapted to the operating system.
# 2) The result of the simulation is written to csv files.
# If complete_data = T (TRUE), then a detailed CSV file is created, in which the individual months of
# each simulated person are recorded.
# If complete_data = F (FALSE; default), then a CSV file is created, in which only the summary for the
# person is stored.

# The concept of long-term depression management (ltdm) is not addressed in the publication, but
# is included in the code for future simulation.
# In the cases analyzed for the publication, the parameters of the management are kept constant and have
# negligible effects on the results.

# 1 - Preparation -----
