

## Supplementary file 4

### SEM after imputation of the variables with missed values (quality of life, social support and seizure frequency in the last 6 months)

The fit indices for the full structural model has indicated adequate fit of the data by  $\chi^2 = 162.8$ , ( $p < 0.0001$ ), CFI = 0.97, TLI = 0.97, SRMR = 0.10 and RMSEA = 0.07.
