OSM 1: horse bits in early China and bit damage

Horse bits at Xinzhen

Based on ancient literature and unearthed archaeological artefacts, before the Western Zhou period (e.g. Shang Dynasty), the horse bits were made of leather, which was replaced by bronze or other metal from the Western

Zhou period (Guo 1998). We can find this trace from a bronze bit, which copies the shape of a leather bit (see Figure S1: left) (Guo 1998). The shape altered in the end of the Western Zhou period and stabilized during the Eastern Zhou period (for a typical form, see Figure S1: centre) (Guo 1998).

In China, rare evidence of organic bits have been discovered at the Yanghai cemetery near the Turfan oasis, western China (see background in Beck *et al.* (2014)). Several bits made of wood and antler were found (see Figure S1: right) (Niyaz 2012). One of the wooden bit comes from Tomb 12, which has been scientifically dated to c. 3000 years ago (Beck *et al.* 2014).

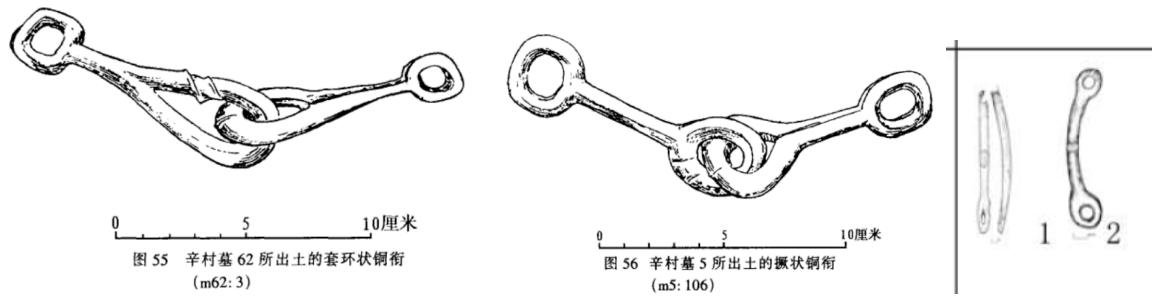

Figure S1. Left) bronze bit from tomb 62, Xincun site (Guo 1998: 61); centre) bronze bit from tomb 5, Xincun site (Guo 1998: 62); right) horse bits made of wood and antler from Yanghai cemetery (Niyaz 2012: 78).

Xinzhen horse data

All the horse skeletons were excavated from the famous Zheng-Han ancient city (Zheng-Han Gucheng, 郑韩故城), the ruins of ancient capital city of the Zheng and Han States in Xinzhen, Henan Province. See details at: http://www kaogu cn/en/Special_Events/Top_10_Archaeological_Discoveries_in_China_2017/2018/0418/61718.html.

All horse skeletons mentioned here are dated to the Eastern Zhou period (770–256 BC), which is divided into the Spring and Autumn period (when the city belonged to the Zheng state) and the Warring States period (when the city belonged to the Han state). The dating is based on forms and artifacts of related tombs. Generally speaking, horse artefacts like bronze bits were not buried with horse and chariots in their pits, but within the tombs around the horse (and chariot) pits. All horses buried in pits Zheng-Han Ancient City are male if the sex identification is available.

Based on observations on lower P2 of relatively well preserved horse skulls from the No. 1 horse and chariot pit

at Cuiyuanxiaoqu (翠园小区) site (24 horses, Spring and Autumn period, Zheng state), No. 1 horse pit at Houduanwanminzhai (后端湾民宅) site (three specimens, Spring and Autumn period, Zheng state), and No. 1 horse pit at Hongyuanshengwu (宏源生物) site (14 horses, Warring States period, Hanstate), we found a majority of the lower P2 show exposed enamel anteriorly (where the cementum has worn away), but the most of them do not display apparent abrasions (see Figure S2). Only a few P2's anterior parts show severe abrasions as well as depressions (see Figure S3). Obvious V-shaped wear of upper and lower P2 occurs, but rarely. See an example in Figure S4, 08ZHCY1-6 (left side).

Figure S2. Lower P2 showing anterior enamel exposure, but without obvious abrasions: 1) 08ZHCY1-8 (horse No 8. from horse and chariot pit 1 at Cuiyuanxiaoqu site, excavated 2008, age ≤ 9 , left side); 2) 08ZHCY1-11 (horse No 11. from horse and chariot pit 1 at Cuiyuanxiaoqu site, excavated at 2008, age ~ 8 , left side); 3) 2010ZHHM1-4 (horse No 4. from horse pit 1 at Houduanwan site, excavated 2010, age ~ 10 , left side); 4) 2012ZHHY1-14 (horse No. 14 from horse pit 1 at Hongyuanshengwu site, excavated 2012, age 5–6, left side) (photographs by J. Cao).

Figure S3. Lower P2 showing anterior enamel exposure with obvious abrasions: 1–2) 08ZHCY1-1 (horse No. 1 from Pit 1 at Cuiyuanxiaoqu site, excavated 2008, age ~12, right side); 3) 2012ZHY1-1 (horse No. 1 from horse pit 1 at Hongyuanshengwu site, excavated 2012, age 9–10, right side); 4) 08ZHCY1-14 (horse No. 14 from horse and chariot pit 1 at Cuiyuanxiaoqu site, excavated 2008, age 3.5, right side) (photographs by J. Cao).

Figure S4. V-shaped wear to upper and lower premolars of horse 08ZHCY1-6 (horse No. 6 from horse and chariot pit 1 at Cuiyuanxiaoqu site, excavated 2008, age 8, left side) (photograph by J. Cao).

Table S1. Bit wear damage from chariot and riding horses from ancient China, ancient Mongolia, and modern Mongolia. Scoring system: 0: no traces; 1: light abrasion on anterior cementum, but no exposure of enamel; 2: exposure of anterior enamel; 3: obvious anterior erosion; 4: occlusal bevel; -: observation unavailable. For full dataset, see Tables S2–3.
