

Supplemental Appendix for *Dominant party rule, elections, and cabinet instability in African autocracies*

This document contains additional information on data coding as well as additional robustness checks that are not included in the main text.

Coding of cabinet instability

The data on cabinets is taken from yearly volumes of Europa Publications Limited (1975–2010). This presents several challenges for empirical analyses. First, Europa records the composition of cabinets once a year, often at irregular intervals. For instance, the composition of Kenya’s cabinet may be recorded in May during year t and in September during year $t + 1$. My own inspection of the data indicates that cabinet composition is usually measured after events such as elections or coups. However, reshuffles can happen multiple times each year. This is something that my coding of cabinet instability cannot capture.

Similarly, the irregular measuring of cabinet composition introduces assumptions into the coding of dismissals and horizontal reshuffles. A minister is coded as having been dismissed in year t if they were a member of the cabinet in year $t - 1$ but are not recorded as part of the cabinet in year t . This coding does not allow for the possibility that the minister actually left the cabinet in the previous year, creating the potential for measurement error. The same problem occurs with the coding of horizontal reshuffles. A minister is coded as being horizontally reshuffled in year t if they are in charge of a different portfolio in year t than they were in year $t - 1$. Therefore, the precise timing of minister dismissals and horizontal reshuffles is not known.

The cabinet composition data also present challenges for the measurement of independent variables representing discrete events such as elections and coup attempts. Fortunately, both NELDA (Hyde & Marinov, 2012) and Powell and Thyne (2011) code the dates that elections and coups take place. This information is used when coding these variables to ensure that the month in which an election or coup took place comes before, or is equal to, the month in which the cabinet was recorded. For example, if the cabinet was recorded in March of 1995 and a coup attempt took place in October of 1995, a coup attempt would be recorded in 1996. If the cabinet was recorded in August 2000 and an election occurred in July of 2000, then 2000 would be coded as an election year because the election came before the cabinet measurement.

Technical details and code files for the coding of the raw minister data are available from the author upon request (akroeger2@ucmerced.edu).

Table A1: Summary Statistics

Statistic	N	Mean	St. Dev.	Min	Max
Dismissals	947	6.099	6.519	0	48
