

**Figure S3.** Multi-group structural equation model predicting anticipatory anhedonia for CC (n = 29), CHR (n = 35), and Depression (n = 88) groups with the subset of participants who completed the full CTQ-Short Form. Significant indirect effect was determined by the 95% confidence interval not including zero.

$p < .01^{**}$ ,  $p < .001^{***}$ .
