

Figure S1. Multi-group structural equation model predicting anticipatory anhedonia for community controls ($n = 124$), CHR ($n = 52$), and Depression ($n = 285$) groups after all participants with past diagnoses of depressive disorders ($n = 65$) were removed from the CHR group. Significant indirect effect was determined by the 95% confidence interval not including zero.

$p < .001^{***}$.
