Public-Private Governance Initiatives and Corporate Responses to Stakeholder Complaints: Appendix

This is the supplementary appendix for "Public-Private Governance Initiatives and Corporate Responses to Stakeholder Complaints." It contains five additional sets of models:

1. Alternative specification 1: Fixed effects logit models (full sample).

2. Alternative specification 2: Fixed effects logit models (multi-firm claims).

3. Alternative specification 3: Conditional logit models (full sample and multi-firm claims).

4. Alternative specification 4: Logit models with MSCI ESG ratings control.

5. First stage results for 2SLS models.

Appendix 1

FE logit: full sample 1.1

1.3 Conditional logit: full sample and multi-firm claims

Table 3: UNGC membership and response behavior; conditional logit results

The inclusion of a large number of fixed effects in models estimated with unconditional MLE is known to bias coefficient estimates when there are relatively few (< 20) observations in each group (Katz, 2001). Conditional logit solves the incidental parameter problem by maximizing the likelihood function conditional on the sum of the dependent variable within

each group $(\sum_{t=1}^{t=T} y_{it})$, thus controlling for group-level heterogeneity without actually including the group dummies (α_i) in the model.² This strategy has been shown to perform better than standard logit with fixed effects when the number of observations per group is small, as is the case in my sample (both regarding firm fixed effects and claim fixed effects).³

²Chamberlain (1980).

³Beck (2018); Katz (2001).

 $^{^{3}}$ Model 2 contains year dummies, rather than maximizing the likelihood conditional on the sum of the dependent variable in each year, as the latter failed to estimate. However, the end result - adjusting for unobserved heterogeneity at the year level - is the same.

1.4 Logit models with MSCI ESG rating control

| | | Dependen | t variable: | | | |
