1. Analysis of implicit treatment and optimised eddy viscosity for the complete set of Reynolds numbers in the Square Duct geometry

Figures 1 and 2 show the comparison of the four cases analysed in Subsection (5.1), namely $RST\text{-E}$, $EV_{RST}\text{-I}$, $EV_{RST}\text{-E}$, and $EV_{DNS}\text{-I}$ for the components U_x and U_y of the SD. The corresponding Reynolds numbers values are $Re = \{2200, 2400, 2600, 2900, 3200, 3500\}$

2. Analysis of implicit treatment and optimised eddy viscosity for the complete set of configurations in the Periodic Hill geometry

Figures 3 and 4 show the comparison of the four cases analysed in Subsection (5.1), namely $RST\text{-E}$, $EV_{RST}\text{-I}$, $EV_{RST}\text{-E}$, and $EV_{DNS}\text{-I}$ for the components U_x and U_y of the PH. The corresponding configurations are $\alpha = \{0.5, 0.8, 1.2, 1.5\}$
