Linear Discriminant Analysis

Model is run with 60-40 partition, with all parameters examined (Spectral Peak, all four spectral moments, duration and relative intensity, formants).

```
## [1] 150
# set seed for reproducible results
set.seed(123)

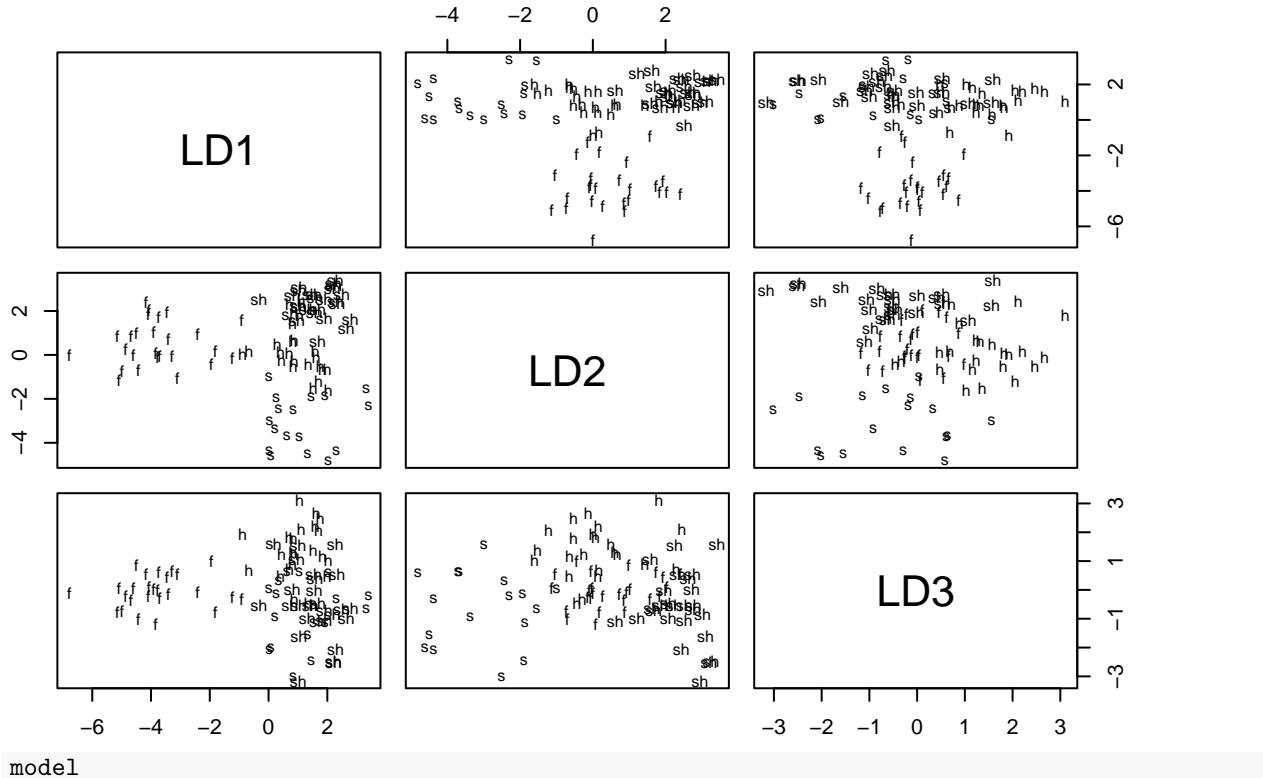

## creates a partition - split data 60% training, 40% test
training <- dat$seg %>%
  createDataPartition(p = 0.6, list = FALSE)

train <- dat[training, ]
test <- dat[-training, ]

preproc.param <- train %>%
  preProcess(method = c("center", "scale"))

train.trans <- preproc.param %>% predict(train)
test.trans <- preproc.param %>% predict(test)

## model includes spectral peak location, 4 spectral moments, AmpDiff and totalDur
model <- lda(seg ~ peak + cog + specSD + skew + kurt + totalDur + DiffAmp + f1 + f2 + f3, train.trans)
plot(model)
```

model
