

Partial altitudinal migration of the Near Threatened satyr tragopan *Tragopan satyra* in the Bhutan Himalayas: implications for conservation in mountainous environments

NAWANG NORBU, UGYEN, MARTIN C. WIKELSKI and DAVID S. WILCOVE

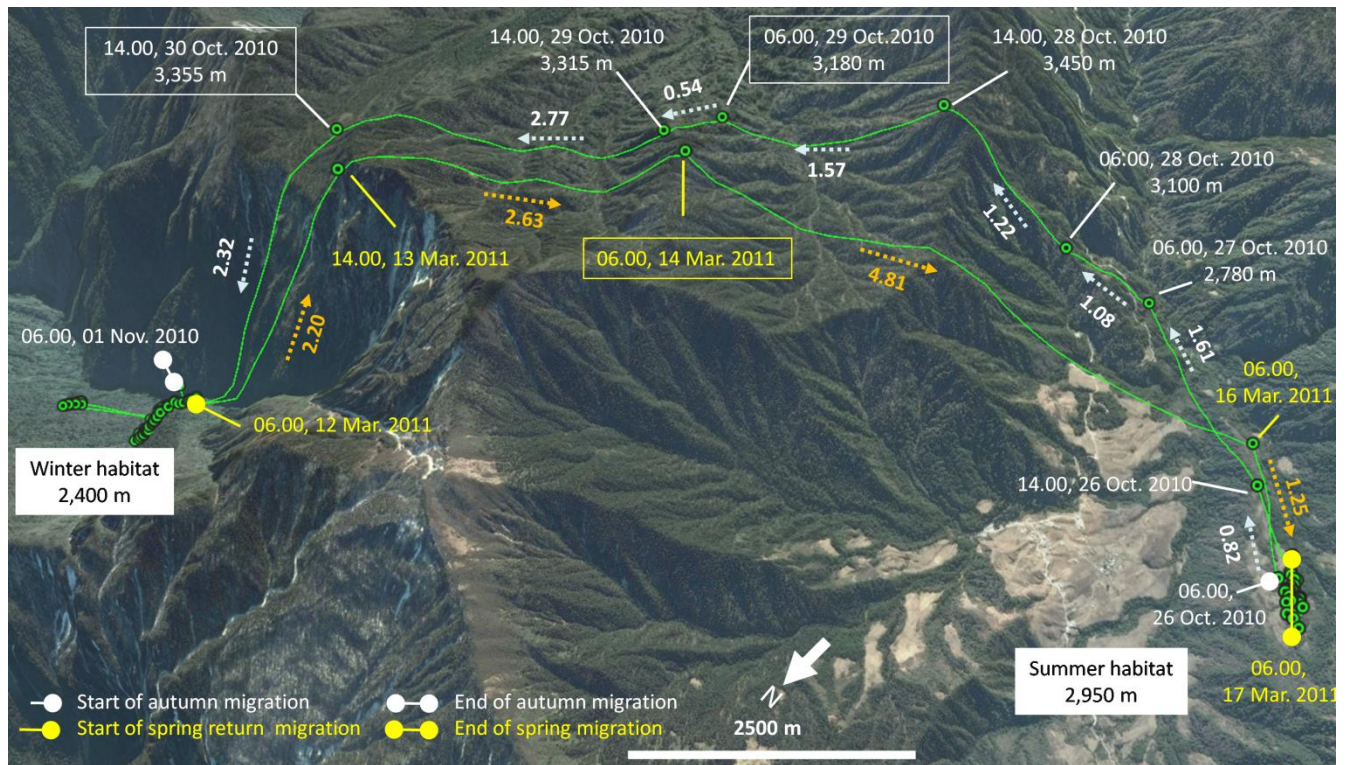

FIG. S1 Migratory route (green lines) of a male satyr tragopan *Tragopan satyra* (tag ID 1419, tagged in 2010; Fig. 2a). Dashed arrows indicate the direction of travel (white, autumn migration; yellow, spring return migration) and the distance travelled (km) each day. Green filled circles indicate locations where GPS readings were recorded, with callouts indicating the time, date and altitude. Where these data are within a bounding box, this indicates the locations were probably night halt stations.
