

Fig. S1. The correlation between number of free-living nematodes and EPG. Nineteen positive cultures were plotted by number of free-living nematodes per 1000 eggs and EPG. The gray line indicates the best fit linear regression ($y = -3.45 \times 10^{-4}x + 2.07$, $r^2 = 0.50$, $p < 0.01$, $df = 13$).
