

**Supplementary Fig. S3.** Protein patterns of the VWs from women with cervico-vaginitis. SDS-PAGE 12% polyacrylamide CBB-stained gels of the proteins present in (A) nine Tv (+) (lanes 1-9) and (B) nine Tv (-) (lanes 10-18) vaginal washes (VWs; Table 1) used to detect the presence of the native TvCP2 protein during infection. Segmented rectangles indicate the protein bands that were excised from the CBB-gels and processed for MS/MS identification in Tv (+) and Tv (-) VW samples.
