

Mapping the genetic architecture of suicide attempt and suicide death using polygenic risk scores for clinically-related psychiatric disorders and traits

Supplementary Tables

- S1. Detailed description of suicide-related clinical scales and corresponding subjects in this study
- S2. Demographic and descriptive data of the GWASs used in this study
- S3. Results of the polygenic risk score analyses setting our GWAS of “suicidal behavior vs. control” as target set
- S4. Results of the polygenic risk score analyses setting GWAS of “non-fatal suicide attempt/suicide death vs. control” as target set
- S5. Results of the polygenic risk score analyses setting our GWAS of “suicide death without MDD vs. control” as target set
- S6. Results of the polygenic risk score analyses setting our GWAS of “non-fatal suicide attempt vs. suicide death” as target set
- S7. Results of the polygenic risk score analyses for suicide-related clinical scores in suicidal behavior cases
- S8. Results of the polygenic risk score analyses for suicide-related clinical scores in controls

Supplementary Figures

- S1. Venn diagram showing the sample overlap for suicide-related clinical scores
- S2. Results of principal component analysis (PCA) for case, control and the CEU population (CEU of the HapMap) in our GWAS cohort of suicidal behavior
- S3. QQ plot of GWAS
- S4. Plot of distribution of polygenic risk scores setting our GWAS of “suicidal behavior vs. control” as target set
- S5. Comparison of odds ratio based on polygenic risk score of MDD between whole suicide decedents and suicide decedents without diagnosed and possible MDD

Supplementary Table S1. Detailed description of suicide-related clinical scales and corresponding subjects in this study

The Hamilton Depression Rating Scale (HDRS)¹

HDRS is the most commonly used instrument for assessing symptoms of depression. The instrument is designed to be administered by clinicians after a structured or unstructured interview of the patient to determine their symptoms. A total score is calculated by summing the individual scores from each question. Scores of 7 or higher generally represent the presence of depression.

Allgemeine Depressions-Skala (ADS)^{2,3}

ADS detects depressive symptoms, based on the Center for Epidemiologic Studies Depression Scale. ADS consists of 20 questions, each with four possible answers giving 0–3 points. Resulting scores of 16 or higher are evidence for a depressive episode³.

Quantitative depression severity score

Merged Z-scores for the above two scales (HDRS and ADS) calculated separately for each site.

Buss-Durkee Hostility Scale (BDHS)⁴

A questionnaire designed to measure a subject's aggression includes the measurement of seven aspects of hostility: assault, indirect hostility, irritability, negativism, resentment, suspicion, and verbal hostility.

Barratt Impulsivity Scale (BIS-10)⁵

A questionnaire designed to assess the personality/behavioral construct of impulsiveness, which is composed of 30 items. In this study, we removed one item- #22 (“I change residences”) to merge the data across site.

Brown-Goodwin Aggression History score (BGAH)⁶

The BGAH is an 11-item interview that assesses lifetime aggressive behaviors across two separate stages of life (adolescence and adulthood). In this study, the scores in suicidal behavior cases were significantly higher than controls ($p < 0.001$ by Mann-Whitney U test).

	Non-fatal suicide attempters		Suicide decedents		Controls	
	Obtained	Missing	Obtained	Missing	Obtained	Missing
Quantitative depression severity score	N = 193 (70/123) Age: 41.82 ± 12.26	N = 67 (26/41) Age: 41.96 ± 11.55	N/A	All subjects	N/A	All subjects
BDHS	N = 179 (65/114) Age: 41.79 ± 12.02	N = 81 (31/50) Age: 42.00 ± 12.22	N/A	All subjects	N/A	All subjects
BIS-10	N = 186 (78/108) Age: 41.15 ± 11.32	N = 74 (18/56) Age: 43.62 ± 13.68	N/A	All subjects	N = 340 (156/184) Age: 53.28 ± 14.68	N = 534 (280/254) Age: 26.46 ± 13.21
BGAH	N = 230 (88/142) Age: 41.79 ± 12.09	N = 30 (8/22) Age: 42.37 ± 12.06	N = 178 (130/48) Age: 46.05 ± 18.22	N = 139 (104/35) Age: 43.84 ± 14.83	N = 417 (215/202) Age: 52.52 ± 15.44	N = 457 (221/236) Age: 22.63 ± 6.87

N: number of subjects (Male/Female). Age: mean age ± standard deviation. Sex and age distributions were compared by Fisher's exact test for sex and Mann-Whitney U test for age within non-fatal suicide attempters group, suicide decedents group and controls group, respectively. Bold means statistical significant difference ($p < 0.05$) between subjects who completed each clinical scale and those who did not.

Details of the references are presented in **online Supplementary Table S2**. The amount of variance explained by the PRS (R^2) is presented on the liability scale at the prevalence rate of suicidal behavior (0.02). P_T : p threshold.

Supplementary Table S4. Results of the polygenic risk score analyses setting GWAS of “non-fatal suicide attempt/suicide death vs. control” as target set

Base	P _t	Suicide attempt						Suicide death

The amount of variance explained by the PRS (R^2) is presented on the liability scale at the prevalence rate of suicidal behavior (0.02). P_T : p threshold.

Supplementary Table S5. Results of the polygenic risk score analyses setting our GWAS of “suicide death without MDD vs. control” as target set

Our GWAS of “suicide death without MDD vs. control” was comprised of 114 suicide decedents without diagnosed/possible MDD and 874 non-psychiatric healthy controls. The amount of variance explained by the PRS (R²) is presented on the liability scale at the prevalence rate of suicidal behavior (0.02). P_T: p threshold.

Supplementary Table S6. Results of the polygenic risk score analyses setting our GWAS of “non-fatal suicide attempt vs. suicide death” as target set

--	----	------	----------	----------

Suicide behavior cases included both 230 non-fatal suicide attempters and 178 suicide decedents. Statistical values were from linear regression model adjusted with sex, age and 10 PCs as covariates. The significance level was set at 0.0023.
