| Number of Observations | 2872 | 1646 | 2872 | 1646 | 2872 | 1646 | 2872 | 1646 |
| Number of Agencies | 22 | 18 | 22 | 18 | 22 | 18 | 22 | 18 |
| Number of Presidents | 6 | 5 | 6 | 5 | 6 | 5 | 6 | 5 |

Note: Quasi-binomial logistic coefficients. Observations are at the agency-quarter level and include fixed effects for agency and President. For Models A-1 through A-4, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-5 through A-8, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-1 through A-4) or the total number of SES positions (for Models A-5 through A-8). Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-1 through A-4) or noncareer SES positions (for Models A-5 through A-8). Central Staff Agency omitted due to time-invariant nature of the variable across all observations. Standard errors in parentheses. Two-tailed tests: *** < 0.01, **p < 0.05 , ${ }^{*} \mathrm{p}<0.1$

Note: Binomial logistic coefficients. Observations are at the agency-quarter level and include random effects for agency and President. For Models A-9 through A-12, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-13 through A-16, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-9 through A-12) or the total number of SES positions (for Models A-13 through A-16). Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-9 through A-12) or noncareer SES positions (for Models A-13 through A-16). These models exclude observations from the Departments of Defense, the Air Force, the Army, and the Navy, as well as the central staffing agencies, due to a lack of data on confirmation duration. Standard errors in parentheses. Two-tailed tests: ${ }^{* * *} p<0.01,{ }^{* *} p<0.05,{ }^{*} p<0.1$

| Number of Agencies | 15 | 15 | 15 | 15 | 15 | 15 | 15 | 15 |
| Number of Presidents | 5 | 4 | 5 | 4 | 5 | 4 | 5 | 4 |

Note: Binomial logistic coefficients. Observations are at the agency-quarter level and include fixed effects for agency and President. For Models A-17 through A-20, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-21 through A-24, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-17 through A-20) or the total number of SES positions (for Models A-21 through A-24). Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-17 through A-20) or noncareer SES positions (for Models A-21 through A-24). These models exclude observations from the Departments of Defense, the Air Force, the Army, and the Navy, as well as the central staffing agencies, due to a lack of data on confirmation duration. Standard errors in parentheses. Two-tailed tests: ${ }^{* * *} p<0.01,{ }^{* *} p<0.05,{ }^{*} p<0.1$

Note: Binomial logistic coefficients. Observations are at the agency-quarter level and include random effects for agency and President. For Models A-41 through A-44, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-45 through A-48, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-41 through A-44) or the total number of SES positions (for Models A-45 through A-48) Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-41 through A-44) or noncareer SES positions (for Models A-45 through A-48). Standard errors in parentheses. Two-tailed tests: " ${ }^{* *} \mathrm{p}$ < $0.01,{ }^{* *} \mathrm{p}<0.05,{ }^{\text {" }} \mathrm{p}<0.1$

Note: Quasi-binomial logistic coefficients. Observations are at the agency-quarter level and include fixed effects for agency and President. For Models A-65 through A-68, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-69 through A-72, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-65 through A-68) or the total number of SES positions (for Models A-69 through A-72) Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-65 through A-68) or noncareer SES positions (for Models A-69 through
A-72). Standard errors in parentheses. Two-tailed tests: "*p < 0.01, " p < $0.05,{ }^{*} \mathrm{p}<0.1$

Note: Binomial logistic coefficients. Observations are at the agency-quarter level and include random effects for agency and President. For Models A-81 through A-84, the dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. For Models A-85 through A-88, the dependent variable is the proportion of Senior Executive Service positions that are noncareer in nature. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions (for Models A-81 through A-84) or the total number of SES positions (for Models A-85 through A-88). Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions (for Models A-81 through A-84) or noncareer SES positions (for Models A-85 through A-88). Standard errors in parentheses. Two-tailed tests: ${ }^{* * *} p<0.01,{ }^{* *} p<0.05,{ }^{*} p<0.1$

| $\operatorname{Var}$ (President) |  |  |  |  | 0.116 | 0.012 | 0.149 | 0.015 |

Note: Binomial logistic coefficients. Observations are at the agency-quarter level and include random and/or fixed effects for agency and President. The dependent variable is the proportion of positions categorized as having a Schedule C appointment type, out of all positions. As these are binomial regression models, the agency-quarter observations are weighted by the total number of positions. Positive [negative] coefficients indicate the covariate is associated with higher [lower] proportions of Schedule C positions. Standard errors in parentheses. Two-tailed tests: ${ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,{ }^{*} \mathrm{p}<0.1$

Table A-15: Determinants of Politicized Positions, March 1987 to March 2017 (Seemingly Unrelated Fractional Probit Models)
