

Supplementary Figure 1: association between survival and localisation of metastasis

Panel A-B: patients were clustered according to the site of major metastases: presence of brain (panel A, brain metastases positive (n= 14) and negative (n= 43)) or lung metastases (panel D, lung metastases positive (n= 30) and negative patients (n= 27)). Difference in survival among groups have been analysis according to Log-Rank test and depicted using the Kaplan-Meier curves. Statistical significance for $P \leq 0.05$. OS: overall survival.
