Table S2: The weighted value assigned for each rupicolous species for both current and future distributions for input into the Zonation software. Non endemic species were assigned a value of one while endemic species were assigned a value of 2. Taxonomically important species were given an additive weighting of plus one. Future weightings were halved to account for the uncertainty in future projections.

Species	Assigned Weighting	
	Current	Future
<i>Afroedura pienaari</i>	2	1
<i>Chondrodactylus turneri</i>	1	0.5
<i>Cordylus vittifer</i>	1	0.5
<i>Lygodactylus incognitus</i>	2	1
<i>Lygodactylus soutpansbergensis</i>	2	1
<i>Platysaurus intermedius</i>	1	0.5
<i>Platysaurus relictus</i>	2	1
<i>Smaug depressus</i>	1	0.5
<i>Trachylepis margaritifer</i>	1	0.5
<i>Trachylepis punctatissima</i>	1	0.5
<i>Vhembelacerta rupicola</i>	3	1.5
