

Wader, gull and tern population estimates for a key breeding and stopover site in Central Kazakhstan

Holger Schielzeth, Johannes Kamp, Götz Eichhorn, Thomas Heinicke, Maxim A.

Koshkin, Lars Lachmann, Robert D. Sheldon and Alexej V. Koshkin

Appendix

Individual sites found to hold more than 1% of the relevant flyway population of any given species or more than 20,000 waterbirds (including ducks, divers, grebes and coot) at least once in 1999–2008. Numbering of sites 1–72 follows Schielzeth *et al.* (2008) while sites 73-86 are new to the list. Species are listed with their maximum count and the number of years in which the 1% criterion was reached (excluding Sociable Lapwing). The number of years in which a particular site was visited in the monthly third when the 1% criterion was reached (in at least one year) is also given (i.e. # years \geq 1% / # years visited). Sites for which individual species are listed fulfil the IBA A4i criterion and Ramsar criterion 6, while sites listed for their total waterbird numbers fulfil criterion A4iii and Ramsar criterion 5. Note that different sites may have identical names and some lakes are so large that they had to be divided into sub-regions. A *zapovednik* is a strict nature reserve. IBA = Important Bird Area.
