¹ In the original *IGO* membership variable, membership in international governmental organizations for the period of 1815-1965 was only collected in five-year periods, whereas continuous data over the entire time-range was available for all other variables in the model. Inclusion of this original variable thus results in a considerable loss of data from N = 13622 to N = 6014. Here we examine the effect of *IGO* assuming that missing values are equal to the temporally previous values for each country, e.g. each value reported for a given country at year 1815, is also assumed to be constant for years 1816-1819. This adjustment, however has no appreciable effect upon the interaction analysis and is of no relevance to the article's primary models.
