

## **Supplemental Materials for: “Quantitative Measures of Wealth Inequality in Ancient Central Mexican Communities”**

by Michael E. Smith, Timothy Dennehy, April Kamp-Whittaker,  
Emily Colon, and Rebecca Harkness

Version 1, 19 April, 2014

This document contains three parts:

1. A description of methods used to identify households and associated architecture at Teotihuacan.
2. Data tables: metadata.
3. Data tables used to calculate the Gini indices presented in the article.

---

### **Part 1: Population, Households, and Compounds at Teotihuacan**

By Rebecca Harkness and Timothy Dennehy

The task of generating estimates of the number of households, and the residential area per household, for Teotihuacan was more complex than anticipated. In this section we describe our procedures, adding details not contained in the main article text.

#### **Background**

The Teotihuacan map, made by the Teotihuacan Mapping Project (“TMP”) was initially digitized at Arizona State University by Dennehy and project interns as part of the research project, “Service Access in Premodern Cities” (Dennehy 2013; Stanley et al. n.d.). Our map, in ArcGIS shape files, includes all archaeological features from the TMP map. There are over 2,400 masonry apartment compounds scattered across the 22 km<sup>2</sup> site, but only a few have been even partially excavated. In order to calculate house area per household, as required by the Gini index, we examined and measured the published plans of six excavated apartment compounds: Yayahuala, Zacuala, Tetitla, Quetzalpapalotl, Tlamimilolpa, and Xolalpan. This sample comprises 0.2% of the total population of apartment compounds at Teotihuacan. Although this is a small and non-random sample, we feel that an estimate based on a small sample, using rigorous methods, is better than no estimate at all.

#### **Identification of Households**

In order to estimate the area per household for the unexcavated apartment compounds, we first determined the number of likely households in each excavated apartment compound, and then divided the total compound area by that figure to get area per household. While some scholars have claimed that compounds are clearly divided into room groups, and while others have used space syntax analyses to examine transport networks and room integration (Hopkins 1987a, 1987b; Robb 2007; Morton et al. 2012), no one had previously discussed exactly which

rooms within a compound constitute a distinct apartment. Also, no one had published estimates of the number of apartments per compound.

Harkness created schematic maps of the six excavated compounds to delineate individual family apartments by combining the spatial depth approach of space syntax (Hillier and Hanson 1984) with a count of the number of doorways per room. This method yielded a count of apartments per compound. We assume that each apartment housed a single household, and we describe our estimates of the size and structure of such households below. Tlamimilolpa was difficult to analyze because its published plan shows that it was not fully excavated. Despite its incomplete nature, we felt we could estimate the number of households it held based on the excavated portion (roughly 77% of the total compound area). Moreover, we felt that using such an estimate was important since Tlamimilolpa may exhibit a common interior organization of apartment compounds in which many families lived in small apartments.

To define households, we traced routes through each compound that begin at an entrance in the exterior wall, and end in rooms that have a single entrance. After locating any exterior entrances to the compound that had been noted on maps, we examined the space that this entrance accessed to see how many other rooms or hallways were connected to it. Perhaps unsurprisingly, we found that there was no one typical space that connected to the street in this manner. Some street entrances led into small rooms that gave way to a courtyard; others simply seemed to enter one of the household units.

After defining the main entrance(s) into the compound, we coded each room in the compound according to its number of doorways. Where possible, apartment boundaries were drawn starting from single-entrance rooms at the termini of access routes. We worked inward from these single-entrance rooms to find clusters of rooms located in a delimited area. We identified these clusters as households. However, there were cases where rooms did not connect into easily defined clusters. In such cases, we used features such as patios with 4 to 5 (or more) entrances and/or platform features to help define apartment boundaries. Rooms leading onto such patios were treated as the front end of the apartment block. The end results of this process can be seen in Figures SM-1 and SM-2 1 for two Intermediate-status compounds, Tetitla and Zacuala palace. Our measurements of apartment size are shown in Table SM-1.

Table SM-1. Calculation of house area per household at Teotihuacan

Compound	# Households	Total area	Average area per household
<b>Intermediate status residences (apartment compounds):</b>			
Xolalpan	4	1,141	285.3
Tetitla	8	4,081	510.1
Yayahuala	6	3,468	578.0
Tlamimilolpa	16	3,522	220.1
<i>Weighted mean:</i>			359.2
<b>High status residences:</b>			
Zacuala	4	3,808	951.9
Quetzalpapalotl	1	2,927	2,927.0

**Supplemental Figure 1.** Reconstructed apartment areas at the Tetitla apartment compound. Base map modified after: Séjourné, Laurette (1994) *Teotihuacan: capital de los toltecas*. Siglo Veintiuno, Mexico City, page 86.

**Supplemental Figure 2.** Reconstructed apartment areas at the “Zacuala palace” apartment compound. Base map modified after: Séjourné, Laurette (1994) *Teotihuacan: capital de los toltecas*. Siglo Veintiuno, Mexico City, page 75.

Single-depth rooms—that is, rooms connected directly to a courtyard or patio through one access point, and which had no other doorways connecting them to other spaces—were not counted as households, since they may have had non-residential functions such as storage or crafting. After counting up the number of apartments in each compound, we noted that our results compared favorably with the space syntax results published by Robb (2007) for Zacuala palace (our method was established without consultation with Robb). Robb also identified four spatially-segregated units (though he stopped short of calling them residential apartments) along with several more integrated (i.e., public) spaces such as patios and single rooms (Robb 2007:062-06, Fig. 5). Similarly, network schematics published by Hopkins (1987b, 1987a) for Yayahuala showed six distinct clusters of rooms surrounding six patios, a number which matches our own estimate of number of residential apartments based on doorways and access routes (Hopkins 1987b:392, figure 4). Our replication of these findings using independent methods gave us the confidence to extend these methods to the other four compounds that had not been independently analyzed.

### **Apportioning Apartment Compound Area among Households**

Harkness measured the area of each household apartment in the excavated compound apartments using the Image-J software. We were not able to extrapolate these data to the unexcavated apartment compounds, however, because of the existence of non-residential space (central patios, shrines, passageways) that did not clearly belong to individual apartments. Our next step was to divide each compound's total area among the apartments within it. Thus, the area per household measurement includes not only each apartment's residential area, but also its share of the total non-residential area of the compound. Thus our figure is not a measure of residential living space per household, but rather of total architectural space per household. This allowed us to compute an average compound area per household for all households of a given status. This feature of our analysis also makes the method resistant to reassignment of rooms from one apartment to another, or to public space instead of residential space. Since the addition or subtraction of a single room wouldn't change the actual number of apartments within a compound, it doesn't change the figure we use to calculate the Gini index: total compound area per household.

Four of our compounds were designated “Intermediate” status – Yayahuala, Xolalpan, Tlamimilolpa, and Tetitla – with a total of 34 apartments among them. One of our compounds, Zacuala, was designated “High” status, and its four apartments provide our only estimate of area per household for High status compounds. The sixth compound, Quetzalpopolatl, proved to be quite difficult to divide into separate compounds – in fact, despite the existence of several room groups, it appears to be a single, palatial residence. Additionally, it includes public ritual and possibly administrative facilities, and fronts directly on the Plaza of the Moon, one of the largest Formal Public Spaces in the city. For this reason, we chose not to include it in the calculations for High status residential compounds.

We calculated the number of households in the unexcavated compounds by dividing their total area (taken from ArcGIS) by the average compound area per household figure that matched their status. This figure is included in the database as #HH. These figures are often fractional; e.g., 3.4 households. We employed standard rounding conventions to calculate an integer number of households per compound (“Rounded #HH”), except for very small compounds which had less than 0.5 households according to our calculations. These were rounded up to 1, since we

assume that each compound housed at least one household. Then, using the rounded number of households, we divided total compound area equally among them to arrive at estimates of total compound area per household.

## Part 2: Data Tables, Metadata

Compiled by Michael E. Smith, Timothy Dennehy, April Kamp-Whittaker,  
Emily Colon, and Rebecca Harkness

The data tables included below were used to calculate the Gini results presented in Table 1. They are posted in pdf format, following Society for American Archaeology guidelines. Researchers who would like the data in a more convenient format (e.g., Excel) should contact Michael E. Smith directly. In each file, cases are sorted from low to high on the relevant variable (e.g., house area or volume, or field area).

### Data Sources

- Cuexcomate and Capilco: These data were compiled from unpublished project data by April Kamp-Whittaker and Michael E. Smith.
- Yautepec: These data were calculated by Timothy Dennehy following procedures described in the text.
- Teotihuacan: These data contain catalog and status data from George Cowgill's Teotihuacan Datafile\, structure areas from the project Service Access in Premodern Cities, and calculations by Rebecca Harkness as described above.
- Census towns. These data were extracted from Cline (1993) by Emily Colon.

### Descriptions of variables

**Type.** For the archaeological sites, the “type” is the wealth or status category assigned to the house by the relevant archaeological project. See text for discussion. For the census towns, “type” is part of the household label. “Q” are houses at Quauhchichinollan, and “H” and “H#” designate two spatial subdivisions of Huitzillan. In each of these towns, household # 1 is the household of the tlatoani, with the largest fields.

**House #.** These are the labels for each house. For Cuexcomate and Capilco, they are house numbers assigned in the site report (Smith 1992). For Yautepec, these are arbitrary labels based on the social tables assumptions described in the text. For the measured sizes of the excavated houses, see Smith et al. (1999), or (Olson and Smith n.d.). For Teotihuacan House # refers to the structure numbers in the Teotihuacan Datafile. For the census towns, these are the numbers assigned in Cline (1993).

**Unit #.** For Cuexcomate and Capilco, these are the labels for the excavation units (Smith 1992).

**Length and Width.** These are the measured dimensions of houses at Cuexcomate and Capilco. Many LPC-A houses lack measurements; the sizes of these houses have been extrapolated from the phased LPC-B houses, using procedures described in the text. For the census towns, these are the dimensions of fields, in *matl*.

**Single dim.** This variable is the field size, in the census towns, for households where only one dimension is given in the source. These were multiplied to 20 to calculate area (see discussion in the text).

**Area.** These are the calculated or estimated areas of residences and fields. For Teotihuacan, “Area” is the total area of the compound or structures.

**Vol.** These are the calculated volumes of architecture, calculated for Cuexcomate, Capilco, and Yautepec.

**#HH.** For Teotihuacan, this variable is the calculated number of households in a structures.

**Rounded #HH.** For Teotihuacan, this is the number of households, rounded to an integer as described above.

**Remaining variables.** The remaining variables are those used to calculate the Gini indices.

- *Main wealth measure* (house area; house volume; field area) for the case.
- *% wealth measure:* the case value as a percent of the total for that measure.
- *Cumulative %:* the cumulative percent for the measure for each case (household).
- *Cumulative % of households:* the cumulative percent of the households, for each case.
- *a and b:* These are cross-multiplications of the two cumulative variables. For case n, a is the product of the cumulative % of the wealth measure for case n, and the cumulative % of the households count for case (n+1). For case n, b is the product of the cumulative % of the household count for case n, and the cumulative % of the wealth measure for case (n+1).
- *Gini value:* This is calculated, at the bottom of each file, as the sum of column b minus the sum of column a. See the text for discussion.

### Part 3: Data Tables

Compiled by Michael E. Smith, Timothy Dennehy, April Kamp-Whittaker,  
Emily Colon, and Rebecca Harkness

The following tables are presented in pdf format. Manipulable versions of these tables (in Excel) will be posted on tDAR in 2015 or 2016, with materials of the project, Service Access in Premodern Cities. In the meantime, the Excel files can be obtained directly from Michael E. Smith ([mesmith9@asu.edu](mailto:mesmith9@asu.edu)).

The following tables follow:

1. Cuexcomate and Capilco, house areas, measured (5 pages)
2. Cuexcomate and Capilco, house volumes, measured (5 pages)
3. Yautepec, house areas, estimated (37 pages)
4. Yautepec, house volumes, estimates (36 pages)
5. Teotihuacan, house areas, measured (73 pages)
6. Huitzillan and Quauhchichinollan, field sizes, from documents (7 pages)

#### ***Explanation:***

- “measured” data are archaeological measurements, originally made during the course of fieldwork.
- “estimated” data are estimates, made following procedures described in the paper.
- “from documents” are data from historical documents, processed as described in the paper.

#### **Supplemental Figures:**
