Supplemental figure 1

For both Boys and Girls, the graphs show the mean difference in birth weight (gram) for different initiation and termination of margarine and milk intake.

- **Boys**: Initiation and termination of margarine and milk are shown with error bars indicating the crude and adjusted differences in birth weight.

- **Girls**: Similar to Boys, the graphs depict the mean difference in birth weight with error bars for crude and adjusted analyses.

The x-axis represents the different events (margarine initiation, milk initiation, milk termination, margarine termination), while the y-axis shows the mean difference in birth weight (gram) ranging from -100 to 80 grams.
