‘Psychomotor development and minor anomalies in children exposed to antiepileptic drugs in utero: a prospective population-based study’

*DMCN* 42: 87–92

Wide et al. have indicated that Table Va (p 90) in their article is incorrect because the odds ratios and confidence intervals are based on those for a matched case-control study, whereas the data for the subjects and control infants are for an unmatched case-control study. The correct Table Va is given below.

Table Va: Number of pairs of infants with minor anomalies exposed to antiepileptic drugs during pregnancy

<table>
<thead>
<tr>
<th>Anomaly in subjects</th>
<th>Anomaly in control infants</th>
<th>Anomaly in subjects</th>
<th>No anomaly in control infants</th>
<th>OR (95% CI)</th>
</tr>
</thead>

</tr>
</tbody>
</table>

Complete protocols on minor anomalies were obtained from 83 complete pairs out of the 87 matched subject/control infant pairs born to mothers participating once or for the first time in the study. Odds ratio (OR) and the 95% confidence intervals (CI) were calculated as conditional logistic regression analyses.
