Appendix C – Supplementary Figures

Figure S1. Leave-one-out sensitivity analysis of the prevalence of extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) rectal carriage at admission in the SoM study. Dots represent point estimates. Lines represent 95% credible intervals.
Figure S2. Leave-one-out sensitivity analysis of the prevalence of extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) rectal carriage at discharge in the SoM study.

Dots represent point estimates. Lines represent 95% credible intervals.
Figure S3. Leave-one-out sensitivity analysis of the prevalence of hospital-acquired extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) rectal carriage at discharge in the SoM study. Dots represent point estimates. Lines represent 95% credible intervals.
Figure S4. Leave-one-out sensitivity analysis of the cumulative incidence of extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) rectal carriage during hospitalization in the SoM study. Dots represent point estimates. Lines represent 95% credible intervals.
**Figure S5.** Leave-one-out sensitivity analysis of the acquisition rate of extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) rectal carriage in the SoM study. Dots represent point estimates. Lines represent 95% credible intervals.
